TELECOMMUTER™

INTEGRATED WORD PROCESSING AND COMMUNICATIONS SOFTWARE

For the Tandy 1000, 1200 and 2000, and IBM-PC/XT/AT and compatible computers. Uses all the Model 100/Tandy 200 TEXT and TELCOM commands.

WHY BUY JUST FILE TRANSFER? TURN YOUR DESKTOP COMPUTER INTO A 'SUPER MODEL 100/TANDY 200'!

For \$200 you can put all this on your desktop computer:

- Full function Word Processor based on and compatible with Model 100/Tandy 200 TEXT Editor.
- Super Power Communications based on and compatible with Model 100/Tandy 200 TELCOM.
- Fast File Transfer between Model 100/Tandy 200 and desktop at 9600 baud. Fully prompted at every step so you'll never get lost. And we supply the cable at no extra cost!
- Host Mode for remote control of desktop computer from Model 100, Tandy 200, dumb terminal, or any computer with Telcom capability.

You don't have to put extra code on your Model 100 or Tandy 200 to transfer files — **no cassettes, no ROM cartridges.** Telecommuter will exchange files with any computer that has an RS-232 port and communications software, even another desktop computer.

Optional advanced features include XMODEM protocol file transfer, full VT100 terminal emulation, Telcom scripts and macros for automatic dialup and file transfer, DOS access from editor, and multiple access level Host Mode. **TC-Corporate** allows individual user assignments, such as password, access level and time limit; keeps activity log.

Telecommuter is a new and significantly easier way to use your portable and desktop computers together. Call or write today for more information on our entire line of fine software products.

We accept MasterCard and VISA for mail or telephone orders, and we ship free in the USA. Upgrade any time for price difference.

TC-standard or **TC-XMODEM** \$200, **TC-DeLuxe** \$300, **TC-plus** \$400, and **TC-Corporate** \$1000.

Look for Telecommuter at your local Radio Shack Computer Store!

An Oracular Spectacular:

Tune in our New Delphi SIG

One of the things we've been wanting to be involved with for a long number of years has finally come to pass. We're very happy about it and I think you will be, too, because it means an expanded capability for you and your computer.

Here at PCM, we figure that we are in the communications business. That is, we believe our primary goal is to communicate things to others; while, at the same time, allow others to share information with one another.

I happen to think we do all this pretty well (and the mail I get from many of you seems to indicate agreement) but there has always been a wish that we could do it better. Now, I think we have a way.

By the time you read this, we will be heavily involved in supplying information to you through a telecommunications capability. We have selected the Delphi network for a number of reasons I will not go into here, but suffice it to say that now you can call up Delphi and join our MS-DOS Special Interest Group (or SIG).

There is no initial cost — either for the first hour on Delphi, for joining Delphi, or for joining the MS-DOS SIG — if you're a PCM subscriber. If you are not, then you can subscribe and get the same benefits. There is detailed infor-

mation elsewhere in this issue.

Delphi connect time is inexpensive after your first free hour. Just \$6 an hour, even at 1200 Baud. But best of all, it offers a two-way communications medium for you and for us. You'll be able to leave your questions on the forum and get answers; you'll be able to communicate in real time with many of our columnists through the conference; you'll be able to participate in polls (and create your own); and, you'll be able to download programs which appear in PCM for a small fee *as well as* have the ability to access a host of free programs from other users of the service.

Leave us a "letter to the editor" on Delphi. And, if it has a question, we'll try to answer. Or, maybe some other member of the SIG will. We'll still print those we think have wide appeal. But your answers should come faster.

"Talk" directly to Bill Barden, Danny Humphress or a host of other people involved with PCM! We'll post conference schedules on the SIG, but we'll also print preliminary schedules in the magazine itself.

Truly, I think Delphi opens a whole new world to us. And, for the first time, will give you an alternate way to obtain program listings from our pages quickly and easily — without having to type them in. Yes, we're still planning on a

disk service at some time in the future, too.

But Delphi isn't the only new outreach program we'll offer. In cooperation with CompuServe, you can now get listings from PCM through their **SOF-TEX** service. As at Delphi, there is a small cost here, too.

We're excited about the new things we will be doing because we see our association with Delphi and with CompuServe as an extension of PCM. We especially hope you'll take advantage of (at least) the free hour of connect time on Delphi and "meet us" in person.

Everyone here at PCM looks forward to hearing from you and sharing information with you. Tune in and say "hello!"

I can't resist mentioning that a number of months ago I reported here that Tandy's super *DeskMate* program would be available for other machines in its line, too. *DeskMate* has been announced for the 2000, as well as the Color Computer and the Model IV. Our new monthly *DeskMate* column called "The Integrated Desk," starting with this issue, will help you make the most of this program.

Now, watch for us to provide you with more excitement in the months to come.

— Lonnie Falk

REDEFINING KEYS

Editor:

I have enjoyed all of Danny Humphress' articles on MS-DOS. He writes so that I not only understand, but I also enjoy reading them. His latest DOSsier, "Exploring ANSI.SYS" (September 1985, Page 72), was of particular interest to me. Ever since I bought my Tandy 2000 I have wanted to redefine my keyboard for one-handed operation in the arrangement developed by Commander August Dvorak, USNR. I have an electric typewriter with that arrangement and it has me completely spoiled.

I used Mr. Humphress' procedure and have written the program as an AUTO EXEC.BAT file so the keyboard is redefined on start-up. It does a fine job, except it is only effective while in MS-DOS. When I run my word processor (*My Word*), the keyboard reverts back to the old arrangement. When I again return to the system, the keyboard returns to the redefined state. Is there any way to retain the redefined keyboard when running this program?

James W. Young
Aberdeen, WA

Editor's Note: Unfortunately, the redefined keyboard only works while in MS-DOS command mode or in a program that uses ANSI's keyboard driver. There are a number of commercially available programs, however, that will allow you to redefine keys. Borland International's ProKey is the one I use most often.

DESPERATELY SEEKING SCREEN DUMP

Editor:

I read PCM every month and I am very glad to see it growing. I started with a Tandy Color Computer and purchased my Tandy 1000 the first week it was available.

I am interested in finding a graphics screen dump program for the Tandy 1000 that will print graphics on a Prowriter 8510A. There must be one out there somewhere. I have looked through PCM and IBM magazines and have not found one yet. Could one of the readers suggest a source for a program like this (commercial or public domain)? Send response to 4730 Robert Frost Way, 95842.

I have purchased many books for IBM BASIC and PC-DOS since there are not many Radio Shack or third party books

available for the Tandy 1000 yet. All of the books or products have been very useful. The Tandy 1000 emulates the IBM PC and PCjr so well it's like having two computers in one. Most of the information in these books applies directly to the Tandy 1000, so don't worry if it says IBM. Anyone who has a Color Computer and a Tandy 1000 should consider buying the program *CoCo-Util* from Mark Data products. This program is an excellent package that allows file transfer between these two fine computers.

Steve Batson
Sacramento, CA

TANDY/IBM DIFFERENCES

Editor:

My first subscription issue of PCM arrived [August 1985]. Now I don't have to hunt the magazine racks every month looking for the latest issue. I like PCM very much and find something of value in every issue.

I have some questions — and these may be of interest to other Tandy 1000 owners.

- I have included a printout of the directories of both the Tandy 1000, MS-DOS 2.11 disk and the IBM PC-DOS 2.10. The sizes of the various files are quite different and, in most cases, the ones on the Tandy 1000 disk are larger. The most extreme example is *MODE.COM* (32,910K on the Tandy; 3,139K on PC-DOS). Why the size discrepancy? To my knowledge, there is no difference in *EDLIN.COM* between the two systems, so why the size difference?

This raises another question: Can I mix and match these files? That is, suppose I use *MODE.COM* from PC-DOS instead of the Tandy 1000 version, what would happen?

- The salespeople at my local Radio Shack Computer Center say the internal hard drive for the 1000 cannot be retrofitted to my 1000. Instead, they say I will have to use the external hard drive. OK, but this weekend, I helped a friend install the Quibie 20-megabyte drive in her Corona. It comes with a short disk controller card that fits in the 1000. And, it costs only \$599!

No one can tell me if the power supply in the 1000 will stand up to the demands of a hard drive. The article in the August issue on networks mentioned you have 1000s with hard drives. What are your feelings on the adequacy of the 1000's power supply?

I have installed a PBJ 512K board and would like to install the Quibie 20-megabyte drive. Would that put too big a load on the power supply?

- In the "MS-DOSsier" column, you mention a device driver, available through

the Tandy Express Order Software, that sets up a RAM disk. The people at the local Radio Shack Computer Center have no idea what that might be. Could you help us out and give us the name?

Robert P. Johnson
Seattle, WA

Editor's Note: Unlike most of the external MS-DOS commands, MODE is usually supplied by the hardware vendor. The versions of MODE for IBM and Tandy have different features and were developed separately. I have used IBM's MODE on a Tandy 1000 with no problems, however.

As far as I can determine, the power supply in the Tandy 1000HD is of the same wattage as the one in the non-hard disk 1000. If you are considering installing a third-party drive, I would suggest purchasing it from a vendor that specifically supports the Tandy 1000.

The RAM disk emulation software driver mentioned in the September 1985 "MS-DOSsier" is called RAMDisk-MS, Radio Shack Express Order No. 90-0146, 29.95.

OOPS!

Editor:

There is an error in the listing of my program in the September 1985 issue of PCM. On Line 120 of Page 30, the last command should be *FI=3*. I would be happy to respond to inquiries that are accompanied by a self-addressed, stamped envelope. My address is 1000 N. Oak Avenue, 54449.

John W. Melski, M.D.
Marshfield, WI

MOVIN' ON UP

Editor:

I started with a Tandy Color Computer and think the upgrade to the Tandy 1000 and PCM was worth the investment. Keep up the good work. It is greatly appreciated.

Bill Barden's article "The Sounds of Science" (September 1985, Page 11), was most amusing.

I would like to see a review of *CoCo-Util* from Mark Data Products. I have a need to transfer files from a Color Computer to a Tandy 1000, and would like an unbiased opinion before I purchase it.

PCM's BROADENING ITS SPECTRUM

PCM and the Delphi Information Utility have joined together to allow Tandy MS-DOS owners all over the world to connect with one another!

Delphi is a full-service information utility. It offers everything from up-to-the-minute news stories from The Associated Press to electronic mail services. But, *best of all*, it now has **a special forum for owners of MS-DOS computers, and it's operated by the people who bring you PCM each month.**

The MS-DOS Special Interest Group (SIG) features a variety of services, including an open forum where you can send and receive messages from Tandy owners all over the world. It also has databases for exchanging programs, where you can upload your favorites and download programs written by other Tandy MS-DOS enthusiasts.

THE WORLD OF MS-DOS

The MS-DOS SIG's conference feature allows you to meet electronically with other members of the Tandy Community. You can join conferences with many notables in the world of MS-DOS on a regular basis. Conference schedules will appear in PCM each month. Be sure to check online announcements for changes and additions.

PCM ONLINE

On Delphi, You can renew your PCM subscription, make a fast and easy order for software or hardware from a multitude of vendors, or inquire about products on the MS-DOS SIG.

We also have a number of **programs that you can download** and use, just for the cost of the time you spend transferring them. There'll also be **corrections for PCM articles**, helpful hints and many other useful features.

FREE LIFETIME MEMBERSHIP

PCM is offering subscribers a free lifetime subscription to Delphi — a \$29.95 value — and a free hour of connect time — a \$6 value at either 300 or 1200 Baud during evening, holiday and weekend hours — so you can sample Delphi and the brand new PCM MS-DOS SIG. **That's right. Your subscription to PCM entitles you to this \$35.95 value as a free bonus!**

If you're not a PCM subscriber, just enter your order when you sign on with Delphi and you'll get the same great deal! For our \$28 subscription fee, you'll get the finest Tandy computer magazine ever, a free lifetime subscription to Delphi and a free hour of connect time.

SAVE EVEN MORE

Want to save an extra \$15? While you're online, you can order the *Delphi Handbook and Command Card* (\$21.95) and three hours of connect time (\$18) for only \$24.95.

Delphi provides us all with **Immediate Tandy Community.** Check it out today. After all, you can sample it for free!

DELPHI

TYPE:
GROUP MSDOS

COMMUNITY TOGETHER!

How to reach the MS-DOS SIG on Delphi . . .

There are several ways to connect to Delphi and PCM's MS-DOS SIG. In most cities you will not even have to pay long distance charges; you can use special data communications networks, like Uninet, Tymnet and the Canadian Datapac network.

First, set your terminal program to operate at either 300 or 1200 Baud (depending on the modem you have), and also select either 7 bits with even parity or 8 bits with no parity, and 1 stop bit. (If one combination doesn't work, try another.)

Decide which network you should use (there is no surcharge for any of them, unless you have to make a long-distance call) and follow the instructions below:

On Uninet: Call (800) 821-5340 to get the Uninet number for your area. After you call the appropriate number for your own area and make connection, press ENTER, the period key (.) and ENTER again. At the "service:" prompt, type GVC (for General Videotex Corporation) and ENTER.

On Tymnet: Call (800) 336-0149 to get the Tymnet number for your area. After you dial your designated number and make connection, simply press 'A' no matter what appears on the screen. When "please log in:" appears, type DELPHI and press ENTER.

From Canada (on Datapac): Call Delphi Customer Service at (617) 491-3393 to get the Datapac number for your area. After you connect, press the period key (.) and ENTER (use two periods if you're using 1200 Baud). Type SET 2:1, 3:126 and press ENTER. Now type p 1 3106, DELPHI; and press ENTER.

From other countries: Many countries have their own data networks that can connect to either Uninet or Tymnet. Check with the telephone authorities in your country for details on how to sign up for this service. When you have an account set up, you can reach Delphi with a "host code" of 312561703088 through Uninet, or 310600601500 through Tymnet. (You'll have to pay the toll charges for this connection.)

Type in Your User Name

If you're already a subscriber to PCM, at the "USERNAME:" prompt, type PCMSUB and press ENTER. At the "PASSWORD:" prompt, type your individual subscription number from the mailing label of your latest

issue of PCM. (If there are one or more zeros at the beginning of this number, include them.)

If you don't already have a subscription, at the "USERNAME:" prompt, type PCMORDER and press ENTER. At the "PASSWORD:" prompt, type SENDSUB and press ENTER. Have your MasterCard, VISA or American Express card ready, because you'll be led through a series of questions that will enable us to put your PCM and Delphi subscriptions into effect. In an effort to hold down non-editorial costs, we do not bill for subscriptions.

If you make a typing error, just press ENTER and start over. Remember that at any point, when you're on Delphi, you can type HELP to get help on how to use the system. To get off the system just type BYE.

If you find that you're unable to log onto Delphi and enter the MS-DOS SIG after following these instructions, call us during afternoon business hours at (502) 228-4492. We'll be glad to offer assistance.

Come Visit Us! Type: GROUP MSDOS

After you sign in, you'll be prompted to set up your own, personal "user name" — Delphi is a friendly service, no numbers to remember — and you'll be asked a number of questions so Delphi can set up your account. You'll also be assigned a temporary password. No time is assessed against your free hour of service while you answer these questions.

Delphi will tell you that your account will be ready after 6 p.m. the same day if you sign up before noon (Eastern time zone.) If not, your account will be ready at 6 p.m. the next day. Once an account is opened, *each PCM subscriber will be credited with an hour of free time!*

When you log back in, use your chosen user name and your temporary password to access the system. At that point, you will meet Max, who will help you configure things and will change your temporary password into your own *personal* password. This is the password you will use for subsequent sessions — or until you change it. Again, there is *no charge* for the time you spend configuring your account. Your hour of free time starts after Max bids you goodbye.

You'll wind up at the Delphi Main Menu; type in GROUP MSDOS and **join us on the MS-DOS SIG!**

*Produce labels with ease with this handy
BASIC program*

The Fantastic Label Machine

By Roger F. Krueger

TAG'R is a small program written in Model 100/200 BASIC that may come in handy for anyone who has a need to print multiple labels. The printer control codes are set for the Tandy DMP-200 printer but may be easily adjusted to accommodate other printers.

At home, I use the program to print return labels and address labels for any bills or payments that occur on a regular basis. Rent, car payments, insurance premiums and water bills are some that seem to pop into our mailbox on a regular basis. I'm sure you can think of others. And since my handwriting seems to be a cross between that of a doctor's and a preschooler's I much prefer using peel-off labels for those important checks which my wife and I send through the mail.

In addition to the options for printing standard sized labels in a "one-up" or "two-up" format, I have included a routine which I call "stencil" that can be used for larger labels (5¾" by 2¹⁵/₁₆") which are very handy for mailing large envelopes and packages.

And now some comments about the program and how it works. TAG'R is an easy-to-use, menu driven program without many bells and whistles. When first run, the program presents a short two-part title screen followed by the main menu which offers five options: 1) Enter Data, 2) Save to RAM, 3) Load from RAM, 4) Select and 5) Quit. To start, select Option 1, Enter Data, and you will be greeted by the

message: (Press ENTER when finished).

At this point, it is simply necessary to enter the address one line at a time up to a maximum of five lines. After the fifth line, you will have the option of correcting the entry by entering it again or continuing to the next address by selecting Y or N. When you have finished entering the addresses you need (to a maximum of 20), pressing ENTER at the LINE 1. prompt will return you to the main menu.

It is a good idea at this point to use Option 2 and save the data to RAM. If the addresses are likely to be needed in the future, it is an easy matter to save the text file which is created to tape using the standard procedures outlined in your owner's manual.

After you have saved your data, it is time to use Option 4 to choose your addresses, set your printing parameters and print your labels.

Upon selecting, you will find a list of the first lines of entries one through five and a single line submenu indicating "Select, Continue and Return." This menu operates by your keying in the first letter of the option you want to use. If you find the first line of the address you want listed on the screen, simply press S followed by the number preceding that line on the display. This will take you to a screen displaying the complete address as you entered it and the choice of going to the hard copy menu or returning to the selection screen.

If you press H, the program drops down to another menu with the following options: 1) Change Font, 2) one-up Labels, 3) two-up Labels, and 4) Return. If you simply want to print regular labels in the normal font, choose either Option 2 or 3 to correspond to the

type of labels you are using and you will then see a prompt requesting the number of labels you wish printed. For two-up labels, enter an even number, and for one-up, any amount. Press ENTER and, if your printer is online and your labels properly aligned, just relax and wait a bit. You should have your labels in a short period of time.

If you decide at the last menu that you wish to either print larger labels or you want a different print style, select Option 1, Change Font. This gives you the choices 1) Label or 2) Stencil. If you choose stencil, you simply have to answer the prompt requesting how many labels you want. If you choose label, you will be offered the following choices: 1) Normal, 2) Bold, 3) Condensed, 4) Compressed and 5) Elongated. Selecting one of these returns you to the hard copy routine menu at which point you choose one-up or two-up labels. Then indicate how many you want and, once again, you should be in the label generating business.

At this point I would like to go back and fill in a few details about how the selection routine works. Pressing C (for continue) will either drop to the next selection screen of five items or the Hardcopy/Return screen with the first address being displayed. Pressing R (for return) at this point will bring you back to the first selection screen, but pressing R in any of the selection screens will return you to the main menu.

Essentially, that is how the program works. It shouldn't take long to get the hang of it. I'd recommend running through the menus and getting the feel for how it works before powering up your printer, and then testing it with plain paper to see the hard copy results before using actual labels.

(Roger F. Krueger works in the field of materials handling in Dansville, N.Y. He has a bachelor's degree in English and is a self-taught BASIC programmer.)

Although I primarily use this program at home, it may come in handy for anyone who works in a shipping department where multiple labels are frequently used. Perhaps, if you work at a plant where it is a common practice

to ship five or more packages to the same address, it could save a shipping clerk a lot of extra typing.

In any event, I have found that it is a definite cure for two well-known syndromes — writer's cramp and

"chicken scratchitis." Well, I think I'd best get back to work on that other program which is kicking around in the back of my head. In the meantime, I hope this one works for you, and happy Model 100/200 computing. □

Text processing power that no other program can equal.

PCSG says "Send it back in 30 days for a full refund if you don't agree."

on Snap-in™ Cartridge \$99.

Write **ROM**®

WRITE ROM is the definitive word processing extension for the Model 100. PCSG the first text formatter for the Model 100, now sold by Radio Shack as Scripsit 100: Now 18 months later PCSG introduces WRITE ROM. Those who have experienced it say WRITE ROM literally doubles the power of the Model 100.

First of all, WRITE ROM as its name implies is on a snap-in ROM. You simply take a quarter and open the little compartment on the back of the Model 100 and press it in. It is as easy as an Atari game cartridge. You can use other ROM programs like Lucid whenever you wish.

WRITE ROM lets you do every formatting function you would expect like setting margins, centering, right justifying and having headers and footers. But it does them under function key control.

WRITE ROM remembers your favorite format settings so that you can print a document without any setup, but you can change any formatting or printing parameters instantly with a function key.

WRITE ROM's "pixel mapping" feature shows you an instant picture on the screen of how your printout will look on paper.

In all there are 64 separate features and functions that you can do with WRITE ROM, and some of these features are truly breakthroughs for the Model 100.

First, WRITE ROM lets you do search and replace. Any word or phrase in a document can be searched for and replaced with any other phrase where the search words appear.

Second, WRITE ROM lets you send any text (formatted or not) to any other computer over the phone with just a function key. What's more it dials and handles sign on and sign off protocol automatically.

Third, WRITE ROM has a wonderful feature called Library that lets you record favorite phrases, words or commonly used expressions (often called boilerplate).

Any place you wish any Library text to appear you just type a code. WRITE ROM automatically inserts the text just like a Xerox Memory Writer.

Picture what you can do with that kind of capability.

WRITE ROM is blindingly fast. No one can claim faster operation. Because it is on ROM it uses virtually none of your precious RAM. It works with any printer, serial or parallel. You can make a duplicate copy of a document file under a new filename. Rename or delete (kill) any RAM file with function key ease.

This description only scratches the surface of the amazingly powerful piece of software. Dot commands allow control of such things as margins, centering, line spacing and other changes in the middle of a document. Most are Wordstar compatible.

A mail merge feature allows you to send the same document to every name on your mailing list, personalized for each recipient.

WRITE ROM enables you to do underlining, boldface and correspondence mode as well as any other font feature like superscripts that your printer supports in a way that many users say "is worth the price of the program."

To underline you don't have to remember a complicated printer code. You just type CODE U, and to stop underline, CODE U again. The CODE key is to the right of your spacebar. Boldface? CODE B to start and stop. Easy to remember and do. Five different printer features of your choice.

We couldn't list all the features here. For example, not just double space but triple or any other. You can use your TAB key in a document. WRITE ROM allows you to indent. This means you can have paragraphs that have a first line projecting to the left of the rest of the paragraph. Plus many more features.

WRITE ROM has a feature unique to any word processor on any computer. It is called FORM. FORM is an interactive mechanism that lets you create screen prompts so that you or someone else can answer them to fill out forms or questionnaires.

With FORM anyplace where you had previously typed a GRAPH T and a prompt in a document, WRITE ROM will stop and you are shown that prompt on the screen. You can type in directly on the screen and when you press F8 you see the next prompt. Goes to a printer or a RAM file.

Think of how you can use FORM. A doctor or nurse could use it for a patient's history with each question appearing on the screen. An insurance salesman could have his entire questionnaire. You could construct a series of prompts to answer correspondence typing the answers, even using Library codes. This feature lets you answer letters in rapid fire fashion each with personalized or standard responses.

Before WRITE ROM you had to be a programmer to create a series of prompts. Now it's as simple as GRAPH T.

PCSG makes the claim that WRITE ROM is the easiest, fastest and most feature rich formatter for the Model 100. We are happy to offer WRITE ROM because it expands the 100 to a dimension of text processing you cannot equal on even larger computers.

We brashly state that WRITE ROM is the best you can buy. But put that to the test. If you aren't as excited as we are return it for a full refund. Priced at \$99 on snap-in ROM. MasterCard, VISA, American Express and COD.

PCM

TMPC

A Plan for Efficiency

For the TRS-80 Model 100

More than a Calendar

TMPC helps you organize your day. It is more than a calendar program; it is a toolbox to help you keep your most urgent tasks at top priority.

Efficiency is no Game

When you use TMPC, you enter the system of screens and corridors shown above and access features by moving through the rooms with the arrow keys. The screens may resemble an adventure game, but TMPC is a serious tool. The user interface will become second nature to you, like walking through the rooms in your home.

Functions for Efficiency

Each screen has its own function. For example, one

screen includes a perpetual calendar, and another shows a "warehouse" of tasks to be done. In other screens you can set entries that repeat weekly, monthly, quarterly or yearly; request a warning of up to 999 days for any entry; sort your to-do list by stress level and priority; and more.

Organization Philosophy

TMPC has more than just "features;" it has a *philosophy* of time management inspired by Stephanie Winston's best seller, *The Organized Executive*. You won't learn all there is to know about TMPC in five minutes, but after using it, you'll feel more *organized*, not just more computerized.

Spreading the Word

One user told us that he felt *guilty* to get so much functionality at so low a price. Find out for yourself. Order TMPC today.

This keyboard tutor provides the skill of a lifetime!

TYPING

What a day! I'm free at last to spend some time playing (make that working) with my Tandy 1000. Here's the latest issue of PCM with that "incredible, does-everything-known-to-mankind" program, mine for the typing. Now, let's see:

```
10 FOR X=1 to 2000
```

Now, where is that 'X' key today? Yesterday, it was somewhere down here in the bottom row. Forget it! I'll be two years typing this one in at this rate.

If this sounds familiar to you, or if you can think of somebody else who might benefit from increased typing skills, then *TYPING 1000* might just be for you. Typing is a skill which is a valuable tool to use throughout life, and

adds much to the enjoyment of computing as a hobby. Like swimming, typing ability, once mastered, is not forgotten.

I have tried to keep the screen format of *TYPING 1000* attractive and at the same time easy to work on. Tandy BASIC is extremely cooperative in this effort, with its variety of screen displays aiding me to this end.

When the program is first presented, a title screen is displayed along with the author's name. When the title clears, we are ready to get down to business. A simulation of the Tandy keyboard is kept on the screen at all times (less numeric key pad). This enables the student to keep his eyes on the screen and not on the keyboard.

Student typists select from four different exercises of an on-screen expla-

nation of the program goals and features. My suggestion is to stay with Selection 1 (Beginner), until you become comfortable with the idea of leaving your fingers on the "home keys" (highlighted on screen in red).

Learning to type is a rewarding experience in its own right and no scores or levels are required to make you feel good. In addition, I have not emphasized speed typing. If you don't know where the keys are, it doesn't matter whether you are fast or slow. Learn the keyboard and the speed will come along by itself. One thing which cannot be over emphasized is this: "Keep your eyes on the screen display, not on the keyboard."

TYPING 1000 does not employ any mind-warping tricks in programming. The style is rather straightforward and

1000

By Leonard Hyre

simple and the average programmer will have no difficulty following program flow. The first action in the program is

to dimension needed string space in Line 120. From there we jump into the title screen, making use of the often neglected Screen 3 to display large letters for the *TYPING 1000* banner.

The subroutine at Line 1410 draws the keyboard display using CHR\$ to create a reasonable likeness of the original. Please note that while this

section has little to do with program operation, it is important to carefully check your work here as an error will give your program the look of an ASCII omelet.

Users are then presented a menu offering a selection which will determine where the program goes from here. The INKEY\$ is used to get the user selection, which then is converted to a VAL\$ numeric. This prevents the student from accidentally messing up the screen by an errant input.

Menu selections one and two share the same subroutines, only using different data for exercises. This routine utilizes Line 410 to call the subroutine at 1110 where the actual control is done. You should remember to press the ENTER key after each exercise is typed in. When a typist completes an exercise correctly four times, he or she hears a "shave and a haircut" and receives a new exercise. (I decided to add a little "pizzazz" to the program.)

Exercise three is a "word practice" format, being handled by lines 490-650. The Selection four gives you a series of "Phrases and Sentences" and is controlled by a separate subroutine in lines

(Leonard Hyre works as a claims representative for the Social Security Administration. He has written several articles for THE RAINBOW, PCM's sister publication for the Color Computer, and is the author of a number of commercial programs. He may be contacted at P.O. Box 403, Cambridge, MD 21613; 301-228-0064.)

690-830. Successful completion of 24 phrases leads to graduation of the student.

If you wish to add or change exercises, it is a simple matter to do. Change or add information in the DATA statements (lines 1850-1920) as you wish,

remembering to also change the READ in Line 1850. Also, if exercises are added, the DIM in Line 120 must be modified.

TYPING 1000 is a long program, but one which you may find of some value in your software collection. If you are overwhelmed at the thought of typing

in such a long program, send me \$7 and a note requesting the program, and I'll send you a copy on disk. My address is L. Hyre, P.O. Box 403, Cambridge, MD 21613. If you encounter problems with the program, feel free to call me at (301) 228-0064 after 5: p.m. ☐

Civilize the DISK/VIDEO INTERFACE • MAKE SAVAGE THE MODEL 100

With DISK-BUDDY software for your DV/I, only function keys need touch your disk files!

Twelve programs for one low price, work together to give the TRS-80 Model 100 unique disk file handling abilities. Access disk files from menu, just like a RAM file. Commands you were tediously typing become simple function key selections. And that's just part of the power of the DISK-BUDDY PAK. It does things you can't:

- Create "superfiles" the length of the disk, over 170,000 bytes!
- Print out, or display on either screen, or copy to disk or other device, a disk data file of any length, **WITHOUT USING ANY ADDITIONAL RAM!**
- Furthermore, transfer records can be "filtered", an example:

An address file on disk can contain more than 1300 entries. You can move to RAM, or screen, or printer, etc., those

records which contain "California" and "Tennis" or whatever. Four logical modes of search are available.

- Also: Features to run, load, save, sort, kill, measure, append, and name, disk files and RAM files, and much more.

PCM Magazine (March, '85) said: "... an excellent buy" ... "manual is extremely well written" ... "will substantially increase the speed and ease of operation of the M-100 with the D/VI."

That was the idea in the first place.

TO ORDER THE DISK-BUDDY PAK (disk and manual): Send name, address, and check or money order for \$39.95 plus \$2.00 postage and handling to the address below. (For COD's call: 212-243-2129)

*A home improvement tool for your
Tandy 1000*

The Handi 1000

By Leonard Hyre

Why is it that everybody seems to have a neighbor whose favorite statement goes something like "so what does it do besides play games?" No use in bringing out *WordStar* or *1-2-3* for this guy — that would send him into future shock. This program, *The Handi 1000* might then be the answer. He or she will be able to readily grasp the conveniences offered by *The Handi 1000* as they apply to his everyday life. And of course, you also will benefit by having a handy set of home improvement tools available when you need them.

The program presented here does all the calculating of materials needed for a number of home improvement jobs and allows the user to make useful cost comparisons rather than jumping blindly into a job. Options include painting, wallpapering, carpeting, tiling, concrete pouring and paneling.

Tandy 1000 BASIC is a powerful version of Microsoft BASIC and offers

us great flexibility in creating useful and attractive programs. I have made use of BASIC's SCREEN 6 by using a CLEAR ..., (32768) statement to reserve the additional memory needed to make utilization of this graphics mode possible. By using SCREEN 6, we will be able to use 80-character text and high-resolution graphics statements on the same screen. This gives us the ability to draw graphics representations of the types of projects undertaken, making measurements, etc., easier to understand.

The LINE and PAINT commands are used often to draw the walls, floorplans, 3-D concrete pours and other graphics representations. These are simple to use and provide an easy way to dress up the screens for the various routines. Also, for those of you not familiar with the many variations of the powerful PRINT USING, you may find the printer option routines interesting to read over. This command allows us to to present attrac-

tive printout formats and still keep all of our command generic; the advantage being a program that does not need to be modified by the user.

From the main menu, you will be presented six options (as listed earlier). The basic screen format for the paneling and painting is shared as is the format for carpeting and tiling. Wallpapering and concrete pouring each get separate graphics treatments. In each case, the user is prompted for the information needed to complete the job estimate. Following the input of needed information, the program offers a hardcopy option.

I realize the listing is a long one, but I believe you will be pleased with the results. *The Handi 1000* can really be a useful program to have in your software collection. If the thought of typing it all in overwhelms you, just send me \$8 to cover the cost of the disk and postage, your name and address and I'll be happy to send you a copy on disk. □

The listing:

PCM

THE PERFECT HOLIDAY GIFT WRAPPING

Do yourself and your PCM friends a favor! Protect and showcase a valuable resource — each and every issue of PCM — with high-quality, brown-vinyl binders embossed with the magazine's name in gold lettering.

Spend more time enjoying your Tandy and less on frustrating searches for misplaced issues!

These handsome binders hold a full 12 issues of PCM and cost just \$7.50, plus \$2.50 for shipping and handling.

SAVE! Buy four or more back issues of PCM with this order and save \$1 per issue. Use back issue form on Page 87.

Order your PCM binders and back issues today!

DISTINCTIVE AND DURABLE PCM BINDERS

YES. Please send me _____ sets of binders at \$7.50 each (plus \$2.50 shipping and handling for each binder ordered). If your order is to be sent via U.S. Mail to a post office box or to another country, please add \$2. Kentucky residents add 5 percent sales tax.

I also want to take advantage of the special savings of \$1 off the single issue cover price for back issues with the purchase of a binder. (An order form from a recent issue indicating the back issues you wish to receive should accompany this order.)

A Brief Survey of Basic Spreadsheet Functions

By Richard A. White
PCM Contributing Editor

A spreadsheet contains a variety of predefined mathematical formulas called functions. These are built-in operations that can quickly perform a task that would otherwise take much longer or which might not be able to be performed at all. In many instances, functions also save memory space since they remove the need to type in long formulas.

A widely used statistical function is @SUM(*x...y*). It simply adds up all the numbers in a row, column or block. The form shown is from *VisiCalc* and *Lotus 1-2-3*. For the discussion below, I will use Lotus syntax. Your spreadsheet may use a somewhat different form, but will work much the same way. Simpler spreadsheets may not contain all the functions discussed, but quite a few are now common to most spreadsheets.

The "at" symbol (@) serves to distinguish the function from a normal label entry. The characters within the parentheses form the argument of the function. An argument is information that a function needs in order to perform its task. In @SUM(*x...y*) the argument is the cell or cells that are to be added together.

@SUM(C6...C25) Compute the sum of the values in cells C6 to C25.

It does not matter in *1-2-3* whether the values have been directly entered or have been calculated by some other formula or function. *1-2-3* does natural recalculation. This means that it determines which cells need to be evaluated to produce values for functions or formulas in other cells to use. It then calculates these first.

Most other spreadsheets are not so kind. They will use a calculated value from another cell in a formula or function, but do not make sure it is properly calculated first. As long as you know this can happen, you can handle the

matter yourself by doing a number of manual recalculations to assure that all formulas and functions are using properly calculated values.

Many functions perform on a range of values. In some spreadsheets, some functions can handle a block as a range, while the same function in other spreadsheets cannot. *1-2-3* handles blocks as I have shown for those functions that accept them. Experiment with your spreadsheet to see what it can do.

Figure 1: Sample Spreadsheet and Formulas.

	A	B
1-	1	4
2-	2	5
3-	3	6
4-----		
5-	6	21
6-		
7-	3.5	
8-----		
9-	24.5	

	A	B
1-		4
2-		5
3-		6
4-----		
5-	@SUM(A1...A3)	@SUM(A1...B3)
6-		
7-	@AVG(A1...A3,B1,B2,B3)	
8-----		
9-	@SUM(A1...A3,B1...B3,A7)	

The more I dug into ways to specify the argument for @SUM() and other statistical functions, the more hidden power I found. In Figure 1, I show a simple example with numbers in cells A1 ... B3 and the results of some calculations. The formula dump is shown below. In Cell A5

(Richard White has a long background with microcomputers and specializes in BASIC programming. He has authored numerous programs and articles. His work has appeared in PCM's sister publication, THE RAINBOW.)

is a simple summation of the row A1 . . . A3. In Cell B5, the summation is taken over the block A1 . . . B3.

In cells A7 and A9, we see that the functions can accept a series of ranges and single cells in the argument. This can open all sorts of possibilities in that it starts to free you from having to think about how you are going to organize your spreadsheet in order to simply perform one of these functions at the end. You still need to organize the spreadsheet logically so you and others can easily understand it and its results when it's done.

`@SUM(A1...A3,B1...B3,A7)`

Note that each range or cell citation is separated by a comma. In addition to being somewhat faster, `@SUM( )` and the other range functions are more adaptable to changes made in the spreadsheet. Figure 2 shows Column A added using a straight cell addition formula. Column B uses `@SUM( )`.

Figure 2: Spreadsheet Using Cell Addition and @SUM() Before Row is Deleted.

	A	B
1-	1	4
2-	2	5
3-	3	6
4-	-----	
5-	<code>+A1+A2+A3</code>	<code>@SUM(B1...B3)</code>

Figure 3: Spreadsheet Using Cell Addition and @SUM() After Row 2 is Deleted.

	A	B
1-	1	4
2-	3	6
3-	-----	
4-	<code>+A1+ERR+A2</code>	<code>@SUM(B1...B2)</code>

When Row 2 is deleted the spreadsheet tries to adjust the formulas. In the case of `@SUM( )` it can, since the missing cell was within the defined range, which is simply shortened by changing B3 to B2. The addition formula always has three cell entries. The spreadsheet was able to adjust A3 to A2, but it cannot make the old A2 entry go away. ERR is entered in its place and will be displayed when the sheet is recalculated.

Of course a range function is not totally forgiving. If you delete the start or end cell of the range, ERR will be substituted. Let's now see what happens when we go the other way and insert a row and add data to it.

Figure 4: Spreadsheet Using Cell Addition and @SUM() After a Row of Data is Added.

	A	B
1-	1	4
2-	2	5
3-	100	100
4-	3	6
5-	-----	
6-	<code>+A1+A2+A4</code>	<code>@SUM(B1...B4)</code>

In the addition formula, the A3 reference was changed to A4. The result returned in A6 remains 6. @SUM() includes the new row and its data in its calculation and puts 115 into B6 rather than 15. In most instances, the reason you added columns or rows was to make room for a larger range of data, and you expect to have the added figures included in the calculation. When you use a range function and make sure that the new rows or columns are between the start and end cells, you are automatically taken care of.

Figure 5: Preferred Way to Define a Range for @SUM().

[	A	]	E	]
1-	Heading A		Heading E	
2-		1		4
3-		2		5
4-		100		100
5-		3		6
6-				
7-	+A2+A3+A5		@SUM(B1...B6)	

Figure 5 shows a better way to define ranges for the @SUM() function. Be careful, since it is the wrong way to describe a range to other functions. I inserted a row at the beginning of the sheet and have shown column headings. I left the formula now in A7 alone to show how the sheet will adjust formulas. I changed the range of @SUM() to include both the cell containing the heading and the cell containing the dashed line indicating a summation. B1 and B6 have math values of zero and will not affect the summation. If you add extra lines for data, you are most likely to add them below the heading or above the dashed line and will always have your new lines within the range.

@COUNT() is another range function. @COUNT() counts only those cells that have a mathematical value including a zero. @COUNT() ignores all blank cells, but considers all cells containing labels as containing zero and counts them. Given this, the better way to describe a range to @SUM is the wrong way to describe the range for @COUNT() in 1-2-3, unless you really want to count cells containing labels. I rather doubt that you will. We can make the point stronger with @AVG() that works the same as @COUNT(). You don't really want a header, valued as a zero, included in your average. @MAX() and @MIN() work the same way.

Those with other spreadsheets, including *VisiCalc*, must check exactly how their particular sheet works. @COUNT(), @AVERAGE(), @MAX() and @MIN() in *DynaCalc* on my Color Computer are able to ignore labeled cells within a range where the same functions on 1-2-3 cannot. And, many times, documentation with programs is either silent on the subject or whatever mention there is is buried in an avalanche of detail. The best way to know is to fire up your spreadsheet and do some testing.

@COUNT() has one other feature (read maybe bug) that you should know about. @COUNT(A1) will return a one *even if* A1 is blank. Further, any @COUNT() function whose argument contains a single cell reference will return at least a one. Assume that cells A1...B2 are all empty. Following are a number of @COUNT() functions and how they react.

@COUNT(A1) = 1
@COUNT(A1...A2) = 0
@COUNT(A1...A2,B1) = 1

This apparently is not a bug since *DynaCalc* on my Color Computer works in an identical fashion. However, I am hard pressed to tell you what value this "feature" has.

One final 1-2-3 "feature" is that @AVG() returns an ERR if the range consists entirely of blank cells. I am of mixed mind on this. If other cells in the spreadsheet depend on this average, it might be worthwhile to flag the lack of data. *DynaCalc* returns a zero, which may not be worth much, but which may not be as upsetting to the operator.

For those who need to calculate statistics, many spreadsheets can calculate the variance, VAR(list) and standard deviation STD(list) for a set of data. I will presume that those who are familiar with these statistical functions and who need to use them will be able to figure out how to use them. If you are not familiar with them, you either don't need them or need far more training than I can give in the column.

The financial functions built into a spreadsheet generally deal with the time value of money. Many larger businesses use the time value of money to select their investments. The idea is that there are always more ways to spend money than there is money to spend. There need to be ways to compare various investments and to choose the best ones from a current prospective. One of the problems is the cash flow each year that an investment may generate varies with time.

Let's consider a fictional company that makes "Whatits" and "Thatits." \$400,000 is available for investment this year and the Whatits and Thatits division managers have been asked to submit plans for that amount of investment in one or the other of the divisions. The investment plans will include estimates of the annual savings and revenue each investment will produce. The company wants at least a 15 percent discounted rate of return. We will see what that means later.

Whatits and Thatits are two very different businesses. Whatits division has to buy some parts from the outside now and investment now would save growing amounts over the next few years, stabilizing five to six years out at \$150,000 annual savings after taxes.

Thatits is booming and a \$400,000 investment this year

will produce \$200,000 after tax revenue next year. But, competition is coming and Thatits is sort of a trendy item. The company cannot count on being in the business seven or eight years from now.

An entrepreneur will typically make a gut feeling decision on the data. In this case neither decision will lead to bankruptcy. On a cash flow basis, one is better than the other and should maximize company profit and strength. 1-2-3's @NPV() is a tool to make the choice. Figure 6 shows the spreadsheet.

Project 1 and Project 2 represent the respective proposals of the Whatits and Thatits division managers. Each proposes to invest \$400,000 this year. Project 1 returns much more cash to the company over 10 years, but much of the return comes in later years. Project 2 returns lots of cash in the early years and then peters out. A primary question is which project has the greatest net present value. Cells in row 21 contain a @NPV() function. The one in B21 reads:

@NPV(.15,B8...B17)

Cells C21 and D21 have similar formulas adjusted for their column positions. One way to look at @NPV() is that the current value of money earned in the future is reduced by the compounded interest that amount of money would earn between then and now. If I put \$1,000 in the bank, two years from now I have the \$1,000 plus earned interest. If I invest \$1,000 now, earn no interest over the next two years and the get back \$1,100, I will probably have less money at that time than if I had put the money into the bank. The net present value of the money investment is less than that put into the bank to draw interest in the CD.

So the first argument in @NPV() is the interest rate or the rate I expect or need to be returned on the capital I invest. Rate of return for short. It is entered as a decimal number though we talk about 15 percent interest. The next argument specifies the range over which @NPV() works.

There is one "big watchout" when you use @NPV(). The first entry in the range must apply to the first interest period. Each succeeding entry must pertain to a succeeding period. The periods must be equal. For most applications, use an annual interest rate or rate of return, entered as a decimal number rather than a percentage, and have your periods be years.

Now we can see differences between the two projects. Project 1 has a larger total return, but Project 2's net present value is better. A more sophisticated analysis would show that Project 2 would pay back its capital investment much sooner, making more money available earlier for other investments. And who can say that the Whatits business will really be as projected five years out. Certainly the projection of Thatits return over the next two years is on much firmer ground.

On the basis of the spreadsheet, the company should invest in Thatits now while they address what to do about the Whatits business. There is some time to act there while there isn't in the Thatits business.

One option is to invest the \$400,000 three years from now when Whatits savings start to peak. The net present value of that approach is only \$260,000, but the net present value of the investment three years out is also about \$260,000. The company can afford to wait and still meet their investment objectives.

Changes your Model 100 into a totally different computer with capability you never thought possible.

LucidTM
on Snap-InTM ROM

Infoworld
rated Lucid's
performance
"excellent"

PCSG says "Satisfaction Guaranteed or your money back within 30 days!"

LUCID[®] is here now. It is on a ROM cartridge that snaps into the compartment on the back of your Model 100. It takes no memory to load and no memory for operating overhead. That means you have the full 29.6k bytes free to store your data.

First, LUCID[®] is memory conserving. It will let you build a large spreadsheet—255 row by 126 column capacity. You build huge spreadsheets in your Model 100's RAM that could consume 80 to 100K on a desktop computer.

Secondly, LUCID[®] is fast. LUCID[®] is so rapid, a 36 column corporate financial statement took less than 4 seconds to calculate.

Thirdly, LUCID[®] has features you won't find in most other spreadsheets. For example, when you type a label (text) it will cross column boundaries; in other words when you type a label or title it will appear as you type it irrespective of column or width. LUCID[®] also allows you to set column widths individually, and of course LUCID[®] has insert row and insert columns, as well as other standard features. LUCID[®] even lets your formulas refer to cells in other spreadsheet files.

Further, LUCID[®] has what no other spreadsheet has: Cut, Copy, and Paste. It uses the same keys as Cut and Paste in TEXT, but here's the difference: it takes all the formulas with it when you paste and they all automatically recalculate with the entire sheet.

And here is what is really amazing. You can copy or cut from one spreadsheet and paste into another spreadsheet or even a TEXT file.

LUCID[®] supports all BASIC math functions as well as Log, sine, cosine, tangent, exponentiation and other sophisticated math functions.

LUCID[®] has so many features that you will say "this is what I need in a spreadsheet", such as automatic prompting of an incorrectly typed-in formula showing just where the mistake was made.

LUCID[®] has expanded "go to" functions that remember and produce a windowing capability.

But perhaps most remarkable is that LUCID[®] is not only a spreadsheet but a program generator as well. First, LUCID[®] lets you protect all cells against entry or change, and then unprotect just the cells you want for someone else to use as input fields.

LUCID[®] will not only process values, but text input as well so that the facts other than numbers can be responded to. LUCID[®] has the ability for you to refer in a formula to cells containing words. This feature combines with the capacity of doing "if then" statements that work by doing table look-ups against even massive X/Y charts of text or numerical information. You can produce a program that responds to inputs with no programming knowledge whatsoever.

You can prepare a report section in your spreadsheet with instructions to your user for printout, and they can produce a personalized printout that responds to their input. All your formulas and tables that did the calculations and provided the facts are invisible to that user. LUCID[®] is useful for doctors for patient questionnaires, troubleshooting technicians, purchase clerks, people doing job quotes, stores for customer workups, insurance agents and anybody who needs to process specific facts and numbers to produce a report based on those responses.

LUCID[®] comes with a manual that explains not only the characteristics of LUCID[®] but will train you how to use a spreadsheet even if you have never seen one before. You are shown how to do budgets, forecasts, breakeven analysis amortizations and many other types of personal and business reports and calculations.

User friendly is such an over-used term in this industry, but a typical comment has been "I have never seen a spreadsheet that does so much, and yet LUCID[®] is so much

easier and faster to use."

LUCID[®] is a result of a most exhaustive developmental effort in which PCSG's objective was to develop a spreadsheet that was better than the state-of-the-art. We are so pleased because LUCID[®] provides for the Model 100 spreadsheet capability you cannot equal on a desktop computer.

LUCID[®] is, in our opinion and that of those who have examined it, a breakthrough. We sell it on a 30 day trial. If you are not completely satisfied, return it within 30 days for a full refund. Priced at \$99, on snap-in ROM. MasterCard, Visa or COD.

*Access BIOS to scan the keyboard,
control windows, and more — all from BASIC*

A Potpourri of BIOS Goodies

By Robert D. Covington

In the last few months, I have described quite a few subroutines that allow GW-BASIC to access features in MS-DOS that are normally only accessible from the DOS command level or other languages.

This month, I will conclude this mini-series on the MS-DOS access subroutine by describing a few remaining subroutines that use MS-DOS's BIOS.

Keyboard Subroutines

Lines 21000 through 23000 of Program 1 contain three subroutines that access MS-DOS's keyboard BIOS.

The subroutine starting at Line 21000, scans the keyboard somewhat like BASIC's INKEY\$ function. Unlike INKEY\$, however, this routine waits for a key to be pressed. This means that the only way to exit this subroutine is to press a key (remember that!). In addition, the most important feature of this subroutine is that it returns the scan code for the character pressed. The scan code is a unique 8-bit number for each of the characters and character sequences on the keyboard.

A list of keyboard scan codes can be found in Appendix D of the *Model 2000*

(Bob Covington has been a computer programmer and consultant for the past six years, most recently focusing his attention on both the Model 100 and the 2000. He is also a technical writer and editor. Bob can be contacted at P.O. Box 37007, St. Louis, MO 63141.)

MS-DOS Reference Manual. Scan codes are especially nice when you wish to make use of the SHIFT, ALT and CTRL in conjunction with the function keys allowing for 48 (40 on the Tandy 1200) individual codes from the function keys. In addition, scan codes also allow you to detect keys that are not converted to individual ASCII characters (like the SHIFT keys). This subroutine has no entry requirements but exits with the ASCII value of the key pressed in C and the scan code in SC.

The subroutine at 22000 returns the current shift status of the keyboard. In most cases, this function's only practical use in GW-BASIC is for detecting the CAPS and NUM LOCK keys. On exit from this subroutine, SS contains an eight-bit number describing the eight possible shift statuses. Table 1 describes each of these shift statuses along with their bit position. (To detect one of the shift conditions, AND SS with 2 to the power of the bit to detect.) For example, to check the status of the CAPS lock key, the following operation could be performed:

```
X=SS AND 2^6
```

Then, if X is greater than zero, the bit is set. Otherwise, if X is equal to zero, the bit is reset and the selected shift is not set.

Probably the most useful subroutine in this set of keyboard subroutines

starts at Line 23000. This subroutine flushes (clears) any characters that are stored in the keyboard's type-ahead buffer. Flushing the keyboard buffer is very useful for clearing out any extra characters that might have been typed on single key input entries (INKEY\$ for example).

If a question was asked that required a Y or N response, the user might end up typing YES or NO. If this happens, the ES or O is stored in the type-ahead buffer and is released at the next input prompt. If an E or O is a valid entry at the next input prompt, it could select an option in a program that the user did not really want. To alleviate this problem, a GOSUB 23000 (or the equivalent line number in your application program) could be inserted right before the second input prompt to clear any characters that might have been accidentally entered, or characters from keyboard bounce.

Display Subroutines

While most of the features of the display BIOS are supported in GW-BASIC, one feature that is not supported is multidirectional and windowed screen scrolling.

In Program 1, the subroutines starting at 24000 and 25000, respectively, scroll the text inside a window on the screen up or down. A window is defined as an area on the screen with borders defined by four points (much in the

same way as the LINE instruction uses four points to make a box in GW-BASIC). Windows are very convenient when you wish to divide the 80-by-25 character screen into smaller sections with independent text.

With the subroutines at 24000 and 25000, the upper left corner of the window is defined by UC (column position) and UR (row position.) Likewise, the lower right corner of the window is defined by BC (column) and BR (row). With all four of these coordinates, the position vector starts with zero (instead of one, as does the LOCATE statement). For example, if you wished to describe the entire screen as a window, the following variable assignments would need to be made:

```
UC=0:UR=0:BC=79:BR=24
```

In addition to the window coordinates, the subroutines at 24000 and 25000 require that NS contain the number of lines to scroll, and AT the attribute to fill the blank line with. If NS contains a zero, the entire window will be erased.

The subroutine at 26000, like the above subroutines, allows a window to be scrolled. This subroutine, however, is a bit more flexible in that it allows the screen to be scrolled in any of the four directions (up, down, left and right). On entry to this subroutine, UC, UR, BC, BR and NS are set up like the above two subroutines. In addition, DS contains a value from zero to three specifying the direction the window is to be scrolled (zero-up, one-down, two-left and three-right).

Miscellaneous BIOS Subroutines

Lines 27000-29010 of Program 1 contain two subroutines that access a few of the more trivial BIOS functions.

The subroutine at 27000 performs a "cold" reboot of the entire system. This function has the same effect as hitting CTRL-ALT-DELETE on the keyboard. This subroutine is very useful when a BASIC program has created a CONFIG.SYS or AUTOEXEC.BAT file that needs to be installed or executed. For obvious reasons, this subroutine has no practical entry or exit parameters.

The subroutine at 29000 loads MS with the total amount of RAM in K (1024 byte increments) that is currently installed in the system. This function is very useful when attempting to create a CONFIG.SYS file inside a BASIC program. By using this function, a BASIC program can determine how much

space can be allocated for disk caches, RAM disk, communications buffers, etc. When using this function, be sure not to detect memory boundaries by exact values. For example, to detect the presence of 512K in the system, do not check if MS is equal to 512, but check to see that it is greater than 500. This has to be done since this function returns a value that is slightly smaller than the actual RAM in the system (usually 1K to 2K less than the actual value).

This concludes all of the routines that utilize the MS-DOS access subroutine. Even though I have described subroutines that allow access to most of MS-DOS's features, a few more trivial features have yet to be implemented in BASIC. Because of this, you might want to purchase Radio Shack's *MS-DOS Programmer's Reference Manual* (26-5403 for the Model 2000 or 25-1503 for the 1000/1200) and see if there are any other functions in MS-DOS that might be usable by your application programs.

References:

MS-DOS Programmer's Reference Manual, Tandy (26-5403)

Table 1

Shift Status Bit Configurations

Bit	Key/Mode	AND Value
0	Right SHIFT	1
1	Left SHIFT	2
2	CTRL	4
3	ALT	8
4	Scroll mode	16
5	NUM LOCK	32
6	CAPS lock	64
7	INSERT mode	128

Programmer's Reference Manual Correction

The *Model 2000 Programmer's Reference Manual* (26-5403) contains a few errors:

- On Page 33, the entry condition to "CONIO" should be:

```
AH=06H
```

```
DL=0FFH for keyboard input
```

or

```
DL=ASCII value of character to display (0-254)
```

- On Page 207, the multidirectional scroll has an additional entry condition:

```
AL=number of lines to scroll (0 to blank window)
```

I have found a few more possible additions/corrections in the manual and I will forward them as soon as possible.

PCM

The Ultimate Expansion for the Model 1000!

TanPak™ by Hard Drive Specialist

7 Functions Include:

- DMA
- Serial Port
- Memory up to 512K
- Clock/Calendar
- Printer Spooler
- Memory Disk
- Expansion Port for Future Options

Features Include:

- Gold Edge Cards
- Pre-Tested and Burned In
- Full Documentation
- Supporting Software
- One Year Warranty
- Expandable to 512K

TanPak™

The TanPak™ expansion board has been designed to allow expansion beyond the scope of the standard Model 1000. Seven of the most needed functions/features have been combined into one package using only one expansion slot. Your remaining spaces are left free for future expansion needs.

Seven Function/Features on One Board

512K Memory Expansion

Socketed and expandable to 512K. This is done by two banks of memory using either two 64K increments (128K), or 256K increments (256K or 512K). This allows a total of 640K in the Tandy 1000.

Serial Port

Using the same configuration as the Model 1000 port you are assured of complete compatibility as well as being able to configure it as COM1 or COM2.

Clock-Calendar

Quartz-controlled for a high degree of accuracy, featuring a battery backup.

DMA

The DMA (Direct Memory Access) is used on the Model 1000's first memory card. It increases memory speed and is a must for hard drive operation.

Printer Spooler

Use part of your TanPak™ memory as a printer buffer. Choose the amount of buffer space you need and stop waiting on your printer.

Memory Disk

Use part of your TanPak™ memory as a RAM drive. With a solid state drive you can store, retrieve, and sort data quickly and easily.

Expansion System

The TanPak™ was designed with an expansion port that will allow upgrading with additional features when they become available. Some of the possible features are: a second parallel port, a second serial port, mouse, hard drive port, bubble memory, A/D, and D/A as well as many others.

TanPak™ 0K.....\$329.

Call for pricing on memory modules.

TanPak™ Secondary

If you already have a Model 1000 memory board and do not wish to replace it, the TanPak™ Secondary is for you. It features Memory up to 256K, Clock/Calendar, Serial Port, Printer Spooler, and Printer Buffer.

TanPak™ Secondary 0K.....\$249.

TanTel™

Internal 300/1200 baud Modem for the Tandy 1000. Supported by the DeskMate software package.

TanTel™.....\$249.

Megabytes for Mini-Bucks

Tandy 1000 Hard Drives
by Hard Drive Specialist

Shop and compare. Hard Drive Specialist has been building hard drive systems for years and have sold thousands of subsystems to satisfied Radio Shack/Tandy customers. We use the latest state-of-the-art disk drives and controllers. Our drives all use buffered seek logic and plated media to result in almost one-fourth the average access times found on our competitors drives. Plated media results in longer platter life and high resistance to head crashes not found on coated media drives. We utilize high quality construction throughout including heavy duty power supplies and gold edge card connectors. Internal drive systems include an interface card and a half-height hard drive that replaces the top disk drive in both size and power consumption. External units include an interface card, case, power supply and hard drive unit. All units require a memory board with DMA such as the TanPak™ multifunction card, or a Tandy Board, Part #25-1004.

Hard Disk System Features:

- : All sizes rated after formatting.
- : One secondary drive may be added.
- : Error checking and correcting controller.
- : Software drivers included.
- : Buffered seek drives for improved access time.
- : Built in power up diagnostics.
- : Plated media for long disk life.
- : Gold connectors used throughout.
- : 1 year warranty.
- : Boots directly from Hard Drive.
- : Uses Tandy 1000 MS DOS.

Of Old Friends, Lead Time and Electronic Publishing

By Randy Graham
PCM Contributing Editor

A recent project led me to revisit some old friends online. I needed to use a bulletin board that I had not called for several years. There was no answer to my call this time. Were they off the air, or had they relocated or changed their number? Where could I find a current listing for this particular bulletin board? Hang on to that question; first, let's talk about the publishing concept of "lead time."

"Lead time" is a term used by writers, editors and publishers to refer to the delay from the time the author finishes his work to the time it is in the readers' hands. To the author, it is that period after which he can no longer make corrections to his text or update his references.

One way to cut lead time is to simplify the editing and publishing process: leave off some of the frills, move things faster from department to department, or distribute directly to the readers as when you publish a magazine. However, lead time for a magazine can run three months or more.

In the popular mind, writers, editors and publishers get frantic about "deadlines" — and they are vital to publica-

tion commitments. But as a writer who wants to be informative, I am constantly concerned about how up-to-date I can be.

This leads us to electronic information dissemination and back to my original question: Where can I find information about a specific bulletin board or database, or one dedicated to a particular need I have? Well, there are a number of good books on the market. I keep two on my computer bookshelf, *The Computer Phone Book* by Mike Cane (New York, New American Library, 1983, \$9.95) and *OMNI's Online Database Directory* by Mike Edelhart and Owen Davies (New York, Collier Books, 1983). How current would the information be that I found there? Computer magazines will have more recent listings but are seldom comprehensive. How can I be sure that I am looking at a complete, accurate list? Enter the old friends.

Peoples Message Service was a pioneer in promoting personal computing and should probably get credit for inventing the concept if not the term "user friendly." They maintain a comprehensive directory of databases, which you can call directly in California (619) 561-7277. You can also find copies of their directory on CompuServe and The Source. Don't try to run or download their whole list — it is just too many pages. Search for the category or area code or whatever. There is adequate help online to guide you. There are directories on many bulletin boards, but I have not found one that comes

(Randy Graham is a rehabilitation counselor working with the handicapped. Personal computing is his hobby; telecommunications, one of his favorite activities. He has done freelance information retrieval and is an inveterate user of the major online systems.)

close to PMS's for completeness and maintenance. Novation, the modem people, used to have a bulletin board with a comprehensive list, but they seemed to have moved since the last time I called them.

On a more professional and commer-

groups are trying. The Source is now offering *Newsbytes* as a weekly newsletter of computer news. And *IF Magazine* is still online in California as a monthly electronic magazine open to the public for a call to (714) 255-8868. In addition, all the information services have a

magazines published about computers, I would have no time left for the computer. Nevertheless, I did run across a **good book** recently on getting started in the online lifestyle: *Dialing for Data* by David Chandler (New York, Random House, 1984; \$9.95). There are a number of such introductions on the market, but I just liked this man's style of writing. If I had gotten around to writing a book, I hope it would have come across as well as his.

"... PCM is sponsoring a special interest group called 'MSDOS' for users of MS-DOS-based machines."

cial level, Dialog is offering *A Database of Databases*. This is a logical step in this rapidly growing field. They have 2,500 listings that give name, source, coverage, availability, costs, etc. This is a valuable and long-needed resource to online searchers.

A New "Magazine"

Back to the subject of lead time in publishing for a moment: can we cut it further with online publishing? Several

bulletin section for news about their own operations, and many BBS's have news sections containing mostly material the SysOp has read and typed in for our edification.

A Good Book

I do not want you to think I have abandoned the printed page to spend my life before the pixelated screen, although I admit that I long ago decided that if I tried to read all the books and

Chapter Two

Last month, I mentioned Delphi's new Tandy users group which is supporting the 1000, 1200 and 2000. As you might already know, PCM is sponsoring a special interest group called "MSDOS" for users of MS-DOS-based machines. (See "Lprint" for more information.) They have a separate SIG supporting the portables; there are also portable SIGs on The Source and CompuServe.

If you are reading this on the plane bound for Princeton, look around for my name tag at PCMfest and say hello. I will be the one with the Model 100 (the grown man's teddy bear) under my arm. **PCM**

RADIO SHACK'S NEW 100K PORTABLE DISK DRIVE CLEARS UP YOUR CASSETTE CLUTTER

MEET THE NEW STORAGE SOLUTION

If you're like most Model 100 or Tandy 200 owners, you've probably found more uses for your portable computer than you ever imagined. This is great, but it brings up the question of storage. Where do you keep all those great programs you write? All that important data?

Until today it's probably been on cassettes—a lot of cassettes. And cassettes are cumbersome, bulky and, well . . . slow. Now there's a better way.

Our new Portable Disk Drive (26-3808, \$199.95) gives you fast access to 100,000 characters on 3 1/2" micro floppy diskettes.

A TRULY PORTABLE DISK SYSTEM

The Portable Disk Drive weighs just 1 3/4 pounds, measures only 2 x 4 15/16 x 6 1/8", and runs on batteries or optional AC adapter. It's small enough to fit into a briefcase along with your Model 100 or Tandy 200. Now you can have a full-fledged disk system wherever you go. Initialization software included.

It's perfect for use with your portable's built-in software. Now you can store and update large documents with TEXT word processing and keep easy-to-store micro disks filed and categorized as you need them.

Or, if you have the Tandy 200 with built-in Multiplan spreadsheet analysis (or the Multiplan ROM pack for the Model 100), it's easy to keep many different spreadsheets on diskette. They're available for comparison and update at any time.

REAL DISK DRIVE POWER

The Portable Disk Drive features easy menu-driven operation. The operating system lets you list the files on the diskette, and features FORMAT, SAVE, LOAD, KILL and RENAME functions. A disk access lamp lets you know that the disk is in use. Another indicator tells you when batteries are low. If they are, the unit will not function, but will finish a job in progress.

SPEED, SIMPLICITY, FLEXIBILITY

Now you can build your software and data library in a cost-effective manner. The micro diskettes are only \$16.95 (package of 3), and cost even less when you buy in quantity. The choice is yours—but we've already stacked the deck. Step up to reasonable storage today!

Last month we discussed the first part of a mini-course in assembly language using the assembler in Debug. This month we'll continue in our effort to give you the rudiments of assembly language and assembly language interfacing to BASIC in 8,000 words or less. But before we go on, we should fill in some gaps that were missing in our earlier discussion . . .

Using Assembly Language on the Tandy PCs

By William Barden, Jr.
PCM Contributing Editor

In the previous examples, we were working with 16-bit registers, usually AX, BX, CX and DX. However, each of these registers can be used as two 8-bit registers, as shown in Figure 1. The upper eight bits of the registers are designated the "high" register and the lower eight bits of the registers are designated the "low" register. AX, then, becomes AH and AL; BX becomes BH and BL; CX becomes CH and CL and DX becomes DH and DL. The other 8088 registers, however, remain only as 16-bit registers. Most arithmetic and logical instructions can use either 16-bit registers or the eight 8-bit registers. We could, for example, add a value of 20 to the AH register by the command `add ah,20`.

Major Instruction Groups

We discussed arithmetic instructions such as `ADDs` and `SUBs` last month and also looked at both unconditional and conditional jumps. Now let's look at some of the other instruction groups.

(William Barden, Jr. is a master communicator in a field in which he is one of the few recognized experts — microcomputers. A prolific author of more than 27 books and handbooks on computers and computer programming, Bill also has authored several instructional software projects for Tandy/Radio Shack.)

The ones we'll describe constitute 90 percent of the instructions you'll typically use in your own assembly language programs.

Logical instructions: The logical instructions perform the same operations as BASIC `ANDs` and `ORs` and exclusive `ORs`. In format they look very much like the arithmetic instructions. The `AND` performs a logical `AND` on an operand:

`and al,3`

If the AL register contained 00010111

and the `AND` above was executed, the result would be

```

      00010110
AND   00000011
      00000010
  
```

The result of the `AND` is done on a bit-by-bit basis, with a result bit being set only if both operand bits are a 1. The `AND` is used to "mask" out fields within eight or 16 bits.

An `or al,3` would perform a second

Figure 1. Eight-Bit versus 16-Bit General Registers

type of logical operation:

```
00010110
OR  00000011
-----
00010111
```

Here, a result bit is set if *either* operand bit is a 1.

The exclusive OR sets a result bit if one, but not both operand bits, is a 1:

```
00010110
XOR 00000011
-----
00010101
```

Shift and Rotate Instructions: The shift and rotate instructions are used to shift data one or more bits at a time. To see how they work, assemble the following code:

```
-a 0100
0930:0100 mov ax,1234
0930:0103 mov bx,1234
0930:0106 mov cx,ffff
0930:0109 mov dx,8000
0930:010C rol ax,1
0930:010E ror bx,1
0930:0110 shl cx,1
0930:0112 shr dx,1
0930:0114 jmp 10c
0930:0116 ENTER
```

You can now see the effect of the shifting by a Debug command called Trace. Trace acts like a G (Go) but stops after a specified number of instructions are executed. For example, to execute 16 instructions starting at location 0100, you'd do:

-t=0100 10

For each instruction executed, the registers are displayed as if an R command had been executed. Execute a series of Trace commands and watch each register in turn. The ROL and ROR instructions rotate data in the registers to the left or right. At the end of 16 rotations, the data is restored to its initial status. The SHL and SHR instructions shift data to the left or right, with zeros being placed into the opposite ends to fill vacated bit positions. At the end of 16 shifts, the entire register has been zeroed. Either 8-bit or 16-bit registers or memory locations can be

rotated or shifted.

To continue tracing from the last instruction, do a -t 10.

Another type of shift is an arithmetic shift. In this type of shift, the sign bit is *sign extended* to the right as the data is shifted. Here's an example:

```
-a 0100
0930:0100 mov ax,8000
0930:0103 sar ax,1
0930:0106 jmp 0103
```

In this example, the initial contents of the AX register is Hex 8000 or decimal -32768. After the first shift, the AX register contains C000, or decimal -16384. After the second shift, the AX register contains E000 or -8192. This sign extension continues until the AX register holds FFFF, or -1. There is only one arithmetic shift in the 8088, the SAR.

Another form of the shift allows you to shift more than one bit position at a time by specifying a count in the CX register. We'll leave that up to you to try out.

Subroutines: Another group of instructions involves subroutine CALLs. A subroutine is one of many instructions used in a program to eliminate rewriting the code each time the same functions are used. Assembly language subroutine calls are identical to BASIC subroutine GOSUBs in their function. The return point of a subroutine call is stored into the stack. The stack (discussed last month) is a special area of memory set aside for return addresses, temporary user data, and interrupt return points and data. At the end of the subroutine a RET (similar to a BASIC RETURN) is used to retrieve the address from the stack and automatically make the return. Like BASIC, assembly language subroutines can be "nested" to any level.

```
-a
0930:0100 call 0105
0930:0103 jmp 100
0930:0105 call 10b
0930:0108 inc ah
0930:010A ret
0930:010B dec al
0930:010D ret
0930:010E ENTER
```

The code above has two nested subroutines, one at 0105 through 010A and the second at 010B through 010D. The first increments the AH register by one count and the second decrements the AL register by one count. Use a Trace command to execute 20 instructions starting at location 0100 to see the action — AH will count up while AL will count down. (AH and AL are part of AX, and are not displayed separately.)

To see what happens in the stack, try this:

First observe the contents of the SS register and SP register. Remember that together they point to the "stack" in memory that holds subroutine return addresses and temporary data. In my system the SS register holds 0930 and the SP holds FFA4 before execution of the code.

Now execute by a -t=0100 3.

This executes the CALL 0105, followed by the CALL 010B, followed by the DEC AL.

At this point, look at the SS and SP registers again. What you will see is that SS is the same but that SP is set to a value four bytes lower than it was initially. In my case, this was FFA4. This reflects the current address of the "top of stack." Remember that the stack builds down. We can take a look at the stack by using another Debug instruction called D (Dump). Dump displays a block of data at one time. To display from 0930:FFA4, do -d 0930:FFA4.

What you'll see will be something like the display in Figure 2.

The Xs here represent "don't care data." Initially the SP was set to FFA8. However, when the first call to 0105 was done, the return address of 0103 was "pushed" onto the stack and the SP was then adjusted to FFA6. This was followed by a call to 0108, and the return address of 0108 was pushed onto the stack. After the push, the pointer was set to FFA4. (The "pushes" are all done automatically by the action of the CALL instruction.) The RET instructions "pop" the return addresses off the stack and adjust the SP the other direction. After two RET instructions the SP now stands at what it was initially, FFA8.

The stack is not only used automatically to store return addresses. It can also be used by PUSH and POP instruc-

Figure 2:

```
0930:FFA0      08 01 03 01-XX XX XX XX XX XX XX XX .....
0930:FFB0 XX XX XX XX XX XX XX XX-XX XX XX XX XX XX XX .....
```

It's the Holmes Engineering/PCSG "chipmunk"

PORTABLE

Disk Drive

for the Model 100/200

\$599

Includes a library of
six powerful programs

Uses the main menu concept. You see the disk directory instantly, arranged on your M-100 screen like your main menu. Just move the widebar cursor and transfer files with a function key. You can run a file directly from the diskette with the ENTER key. Uses 3½" microfloppy diskettes that have a rigid plastic casing and a metal core. They're tough and nonflexible. You can carry several in a shirt pocket without damage. There's 358K on a diskette. Ten of these in your briefcase and you've got 3½ megabytes.

Drive weighs only three lbs. and it works directly from the 110 outlet and recharges at the same time. It recharges in six hours with thousands of pages transferred between charges. It's compact, with dimensions of 2¼" x 5½" x 7.5"; and fits easily into your briefcase along with your Model 100 or 200.

Machine code programs, BASIC programs, *Lucid* files and documents all are saved and retrieved with no protocol—instantly, ready to run.

In a special association, Holmes Engineering and PCSG have worked together combining the hardware knowledge of Holmes and the software expertise of PCSG. The result is a product that can only be regarded as excellent.

You see the disk directory instantly; works just like the main menu

Here is what is really exciting. The portable disk drive has Random Access. Included as part of the operating system in the drive (ROM) is a very powerful disk BASIC.

This means that you can have BASIC programs that will access the diskette and read and write records directly on the diskette.

Just imagine yourself with this kind of capability.

Database—The portable disk drive stores your mailing list, inventory items, part #s and descriptions or any other data that you need to recall.

358K on a diskette

Invoice (purchase order)—At the touch of a button you can print out your sequentially numbered, professionally done invoices. This is truly professional invoicing capability.

Purchase orders are just as easy.

Sort—This excellent utility allows you rapid sorting of any records you have compiled. You can write the newly sorted list back in the same file on the diskette or to a new file.

Telecom interface—If you are a user that likes to access other computers or databases (for example CompuServe) by telephone then this powerful facility alone is worth the price of the disk drive. You can automatically download and upload information onto the diskette.

Calendar—Everyone who has seen this program has said, "This is the first calendar/

diary/scheduler on any computer anywhere that I can use. It is so functional."

The calendar program is usable for two reasons, first it is designed correctly, and second you have the memory (358K) on the diskette to log and access a tremendous amount of notes over a long period of time.

Personal Finance Manager—This wonderful program truly lets you keep track of your finances.

All your records are kept on the diskette. Bank accounts (checking and savings) and charge accounts such as MasterCard and Visa.

We at PCSG believe we have the ultimate Model 100 system, the Portable Disk Drive plus the *Lucid* spreadsheet on snap-in ROM, *Write ROM* word processing and the new 64K RAM expansion now available from PCSG.

We want you to find out for yourself at no risk. If you aren't totally satisfied within 30 days, simply return the disk drive for a full refund. Priced at \$599.95, including the software library. MasterCard, Visa, COD.

PCSG offers a 30-day/money-back trial!

tions to store register data temporarily. This is often done so that the registers can be used for other purposes. Any data that is stored, however, must be retrieved, or at least the SP must be set to the initial value. Here's an example of a storage of AX and BX and a later retrieval:

```
push ax
push bx
.
.
pop bx
pop ax
```

Note that the registers are restored in the reverse manner from which data was stored. As a point of fact, however, data does not have to be restored in the same registers, or even restored at all, as long as the SP is set back to what it was initially.

Other 8088 Instructions

We've covered a large number of instructions above, but haven't touched on a number of the more interesting instructions in the 8088, such as the multiply, divide and string processing instructions. We'll cover some additional instructions in the remainder of this column, but can't describe every instruction. One thing that will be indispensable is a good reference book on 8088 assembly language. Probably the best place to start is to look at publications by Intel, the manufacturer of the 8088. Technical book stores may have the Intel "iAPX 88 Book," which provides a detailed breakdown of the 8088 instruction set. Books by other authors range from fair to excellent. The IBM *Macro Assembler* or equivalent Radio Shack documentation is also helpful, but is bundled with the software, and you may not choose to make the investment at this time.

Application Examples

We now have a little knowledge of assembly language and should be well prepared to create chaos on Tandy 1000s, 1200s or 2000s. In all seriousness, however, there's not too much trouble we can get into. If the system "locks up" and you can't get back to Debug, just reload and start again. We'll also show you how to save a memory image on disk so you will be able to restore longer programs without having to reenter everything from scratch. We'll consider two programs here. Program 1 will change all uppercase characters to lowercase characters. Program 2 will fill

the display screen with any given character.

Program One: Uppercase to Lowercase

Like any programming problem, the first step is to do some thinking about what's involved. Uppercase and lowercase characters are both represented in PC compatibles by ASCII codes. The ASCII codes for uppercase 'A' through 'Z' are 65 (decimal) through 90 (decimal), while lowercase 'a' through 'z' are 97 (decimal) through 122 (decimal). We'll assume that we're given an address of a text string of a given length. Since this assembly language code will probably interface to BASIC, we'll assume that the text string will be no longer than 255 characters. The address could be anywhere within the BASIC segment, so we'll need a 16-bit address value that points to the beginning of the text string. The process would appear to involve "scanning" a text string from beginning to end, looking at each character to see whether it is an uppercase character. If it is, we'll change it to the corresponding lowercase character by setting bit 5 of the character. An 'I' Hex value of 49, for example, binary 01001001, can be changed to lowercase by setting bit 5 — 01101001.

By the way, this is not something that an experienced assembly language programmer can immediately sit down and crank out. He'd have to do some head scratching first, just as we're doing.

My first programming attempt produced this:

```
-a0100
0930:0100 cmp si,di
0930:0102 je 115
0930:0104 mov al,[si]
0930:0106 cmp al,40
0930:0108 jle 112
0930:010A cmp al,5a
0930:010C jg 112
0930:010E or al,20
0930:0110 mov [si],al
0930:0112 inc si
0930:0113 jmp 100
0930:0115 ENTER
```

One thing that you might notice in entering the address for the JMP is that you don't know beforehand what the addresses will be. For example, when entering JE at 0102, you don't know at that point that the ending point of the program is at address 115 because you haven't entered all of the instructions and Debug has not computed the instruction lengths. In these cases, simply put in a "dummy" address, such as 1FF, and then go back with a single location

A to enter the correct address after all of the instructions have been entered.

Let's look at the program in detail. The program assumes that the starting address of the text string will be in the SI register and the ending address of the string will be in the DI register. SI and DI are typically used to hold addresses in this fashion. We'll see why in a moment.

The CMP instruction compares the contents of SI and DI. If they are the same, the last byte (character) of the string has been reached then the program ends with a jump (JE) to location 115. Location 115 has no instruction, but we'll just breakpoint there for the time being.

If the contents of SI and DI are not equal, then there are more characters to process. The "current" character is moved into the AL register by MOV AL,[SI]. This instruction uses the SI register as an "index register" that points to the next character. Remember that SI contained the starting address upon entry into the program. SI will be incremented by one as each character is tested. The MOV AL,[SI] form of the instruction loads the AL register with the character pointed to by the SI register.

With the current character in AL, the next step is to see if the character falls between 40 and 5A (Hex). Two compare/conditional jump combinations are used for this. The first tests for AL less than or equal to 40 and jumps to location 112 if so. In this case the character is not an uppercase text character. The next tests for AL greater than 5A. If this condition exists, the character is a higher value than an uppercase text character and a jump is made to location 112 again.

At 10E, the character in AL must be within the range of 41 through 5A, an uppercase text character. The OR AL,20 instruction ORs the contents of AL with the Hex value 20 (binary 00100000), setting bit 5 and converting the character from uppercase to lowercase. The character is then stored back to memory by using the SI register contents as a pointer once more. SI at this point has not changed. The next instruction is executed in all cases. It increments the contents of SI by one to point to the next character. An unconditional Jmp is then made back to the beginning of the program. The tests are repeated for every character in the string.

How can we test this program? Almost every program requires some testing and the testing usually takes as much time as writing the program in the

USE YOUR DESKTOP COMPUTER AS A DISK DRIVE FOR YOUR M-100.

Disk+

on Snap-In™ ROM

Try *Disk+* for 30 days. If you aren't as excited as we are, return it for a full refund.

When we designed *Disk+* we did it out of necessity. We wanted a way that we could just connect a Model 100 to our desktop computer with a cable and save files onto the desktop's disk drive. We wanted it to be so simple to use it would be self-explanatory.

Picture this. *Disk+* comes to you on a Snap-in ROM and a diskette for your desktop. You take a quarter and open the little compartment on the back of your Model 100. Then you just press the ROM into the socket. *Disk+* appears on your main menu just like a built-in.

You connect your Model 100 to your other computer using an RS232 cable (available from PCSG for \$40).

You just place the *Disk+* diskette into the desktop's drive and turn on the computer. It powers up automatically and says "awaiting command" on your desktop's screen. Then you just put the widebar cursor on the Model 100 main menu on *Disk+* and press ENTER. You are shown your RAM files arranged just like the main menu.

To save a file to your other system's disk drive, you just move the widebar cursor to the file you want to save and press ENTER. It is saved instantly with no further action.

To look at the disk directory, you just press a function key on your Model 100. You see immediately the disk directory on your Model 100 screen, and it is arranged just like your Model 100's main menu.

To load a file from the diskette to your Model 100, you just move the widebar cursor to the file and press ENTER. The file is transferred to your Model 100's RAM instantly. You can press F8 and go back to the main menu, and the file you loaded from diskette is there, ready to use.

It is so nice to be able to keep your documents, programs (both BASIC and machine code) and *Lucid* spreadsheet files on the diskette, and bring them back when you need them. All files are ready to run or use with no changes or protocol by you.

If you have access to a desktop computer and don't have *Disk+*, then evidently we have done a poor job telling you about it.

All files and programs that you load or save, go over and come back exactly as they are supposed to be because of full error checking. This guaranteed integrity is really a comfort. *Disk+* is wonderful in so many other ways. For example, you can do a "save all" of all your RAM files with just a touch of a function key. That group of files is saved on the diskette under a single filename with a .SD (for subdirectory) extension. Any time you want, you can bring back all those files at once, or just one or two if you like, again with one-button ease.

Disk+ takes up no RAM. That's zero bytes either for storing the program or for operating overhead.

What really excites most *Disk+* users is text file cross compatibility. Your Model 100's text files are usable on your desktop computer, and your desktop's text files become Model 100 text files.

This means you can write something on your Model 100, and with *Disk+* transfer it

instantly to your desktop and start using it right away on your bigger computer. Or the way we like to work is to type in a document on the desktop computer and then transfer it to our Model 100 with *Disk+*. Then we print out the document, beautifully formatted, using WRITE ROM.

Disk+ works with just about every micro sold, from IBM PC and its clones, to all Radio Shack computers (yes, all), to Apple II, Kaypro, Epson and most CPM. Just ask us. More than likely, your computer is supported.

Incidentally, hundreds of Model 100 owners have gone to their Radio Shack stores and bought a color computer because it is so low priced, and with *Disk+* they have an inexpensive disk drive.

And if that weren't enough, how about this: *Disk+* also provides cross-compatibility between different computers like IBM, Apple or the Model 4 using the Model 100 as the intermediary device. Quite a feature!

The snap-in ROM is really great because you can use other ROMs like *Lucid* or WRITE ROM. They snap in and out as easily as an Atari game cartridge and you never lose your files in RAM.

Anyone who ever uses *Disk+* simply can't do without it. But so many times we have had new users call us and say, "Wow! I had no idea when I ordered it that *Disk+* would be so fantastic. I just couldn't believe that I could use my desktop computer's disk drive with my Model 100 just like it is another main menu."

That's why we sell *Disk+* on a thirty-day trial. If you aren't completely satisfied, return it within thirty days for a full refund. Priced at \$149.95 on Snap-in ROM. MasterCard, Visa or COD.

© PCSG 1985

first place. In this case, the testing will take even longer. Let's start out with a single byte of test data in an unused location, say location 0120, to keep the data away from breakpoints and the program. We'll put an uppercase 'A' into location 0120 by this command:

```
-e 0120 "A"
```

This Debug command enters an 'A' into location 0120 which we can verify by a Dump:

```
-d 0120
```

Now we'll use the R command to change the SI and DI registers to point to 0120:

```
-r si
SI 0000
:0120
-r di
DI 0000
:0120
```

At this point we should be set to go. A quick check of the registers by another R command verifies that SI and DI contain 0120. We'll execute at 0100 and breakpoint at 0115:

```
-g=0100 0115
```

After reaching the breakpoint, however, we've found that location 0120 still contains an uppercase 'A' rather than a lowercase 'a' as we expected. What's wrong? A little more head scratching uncovers this fact: The comparison of SI and DI in the first instruction immediately terminates the program! The JMP instruction should have been JG, or JMP if SI was greater than DI. Making the change, we now have:

```
0930:0100 cmp si,di
0930:0102 jg 115
0930:0104 mov al,[si]
0930:0106 cmp al,40
0930:0108 jle 112
0930:010A cmp al,5a
0930:010C jg 112
0930:010E or al,20
0930:0110 mov [si],al
0930:0112 inc si
0930:0113 jmp 100
0930:0115 ENTER
```

Now reset the SI register to 120 and execute. This time execution reveals a 61 Hex in location 0120, equivalent to an ASCII 'a'. Heady with success, we use the Debug E command to create a string of characters:

```
-e 0120 "NOW IS THE TIME"
```

The SI and DI registers are then set for the new string:

```
-r si
SI 0000
:0120
-r di
DI 0000
:012e
```

After a check of the registers by R, we execute again. This time a d120 reveals that the data in the 120 area has been set to "now is the time." One more test might be nice, a test to see that no data is changed when it shouldn't be. E is used again to enter data that should not be changed:

```
-e 0120 "asdf1234#$$"
```

A check after execution reveals that this data has not changed. At this point we can say that the program appears to be working. However, there may still be bugs lurking within!

Program Two: Fill the Display Screen With a Given Character

The next program we'll consider is a program to fill the display screen with a given character. As in the first program, we'll need to do a little thinking about the design of the program before beginning. The display screen for a color graphics display is located at absolute memory address B8000, as shown in Figure 3. Each character

Figure 3. Text Mode for Color Graphics

position in text mode is made up of two bytes, the actual ASCII character displayed and an "attribute" byte. The attribute byte controls blinking, foreground color, and background color as shown in the figure. To fill the screen with a given character, then, means writing the character to every even-numbered byte starting from B8000 and ending 2,000 bytes later, in 80-character mode (25 lines at 80 characters is 2,000 characters). Each attribute byte should probably also be set to some reasonable value. We'll use a value of 15 decimal for a normal text display. See Figure 3.

The main problem here is how to address the B8000 area. We know that we can address 64K bytes within a current segment, but how do we address another segment? One way to do it is to use the ES, or extra segment register. If we set that to B800, we'll be addressing the start of the video display memory.

Our first rough attempt at this problem produces:

```
-a 0100
0930:0100 mov bx,b800
0930:0103 mov es,bx
0930:0105 mov cx,7D0
0930:0108 mov al,15
0930:010A mov si,0
0930:010D es:mov [si],ah
0930:0110 es:mov [si+1],al
0930:0114 add si,2
0930:0117 dec cx
0930:0118 jnz 10D
0930:011A ENTER
```

Let's look at this code in detail. First, we've made the assumption that the character to be stored is in the AH register. AL will hold the value to be put into the attribute byte. The ES register is loaded with the value B800 by first loading the AX register and then transferring the value. The CX register is then loaded with a count of 2000 (7D0 in Hex), representing the 2,000 characters that must be transferred. The AL register is loaded with the attribute value. The SI register is used as an index register in the same fashion as in the preceding example. The 0 represents an offset of 0; it will be incremented during the transfer of data.

The main loop of this program is at 10D through 118. Each time through the loop, the character to be displayed is stored from AH, and the attribute byte is stored from AL. A MOV accomplishes both stores. The first store is to the offset pointed to by SI. The next store

is to the offset+1. The ES: mnemonic is called a *segment override* mnemonic. It tells the 8088 that the following instruction will reference the ES segment, rather than the DS segment as would be done without the override.

The ADD instruction adds 2 to the SI register to point to the next two bytes, the character and attribute bytes. The CX register is decremented by one. When CX is decremented down to zero, 2,000 stores of the character and attribute byte will have been done, and the program is over. If 2,000 stores have not been done, however, the program continues by the JNZ 10D.

Before executing this program, we must put the character to be stored in AH. This can be done by

```
-r ax
AX 0000
:4100
```

Note that the AX register must be specified. It's not possible to fill only one half of the AX register by AH or AL.

Now a Go can be executed with a breakpoint at 011A:

```
-g=100 11a
```

Sure enough, as in most assembly language programs, the code did not work the first time. I got a washed out set of A's on my black and white display. A little investigation turned up the fact that the AL was loaded not with 15 decimal, but with 15 Hex as in the code above. Change the line to

```
mov al,f
```

and the program will work.

Saving and Reading Programs From Disk

Three more Debug commands may prove extremely helpful. It is possible to save a *core image* of the assembly language code and data you've entered by first *naming* a file by the N command:

```
-n alnum1.dat
```

Next, the number of bytes to be written must be loaded into BX and CX:

```
-r bx
BX B800
:100
-r cx
CX 0000
:100
```

We've used 100 bytes (256 bytes decimal) here as an arbitrary value, but you should use a value dependent upon the program size. Finally, the address of the start of the data is specified in a Write command. If no address is specified, the data will be written out from location 0100.

```
-w
```

When the write is being done, you'll see the message

```
Writing 100 bytes (this example)
```

Thereafter, to load in the file containing the data, just do an L command:

```
-l
```

(If you are loading in the file initially, however, you must first specify a file name by using an N command.)

Interfacing To BASIC

All of the above is well and good, but what do you do with the assembly language program once you have it? One excellent idea is to interface it to BASIC. That way BASIC and assembly language can work together, BASIC providing the input and output formatting, and assembly language providing the high-speed processing for those time-critical functions such as sorting and string processing.

Let's see how this is done by taking one of the two application examples above and using it with a BASIC "driver." We'll choose the screen display.

First, we must determine the memory in which the assembly language program is to reside. BASIC operates in a 64K segment as shown in Figure 3. The top of this segment can be "protected," or reserved for assembly language, by loading basic with the /M switch. An example is

```
A>BASICA /M:60000
```

which reserves offset locations 60000 up to 65535 in the BASIC segment for assembly language subroutines. Anything put in these locations will not be touched by BASIC as it uses its stack and string storage area. A similar command is CLEAR, 60000 from within a BASIC program.

If you have a system with minimum memory, by the way, you'll probably have to use a much smaller value for this protected area, as there may not be that much memory left over by the time BASIC, video graphics areas, and so forth are loaded. For that reason, we'll use a value of 25000 in the following,

allowing the program to run on 128K Tandy 1000 systems.

The next requirement is to move the assembly language code into the protected area. One convenient way to do this is to store the machine language code in the form of data statements with the &H prefix. Before we do that, though, we've got to modify our code slightly to enable *parameters* to be passed from BASIC to assembly language. (In other cases, parameters may be passed back the other way, or in both directions.)

Here's the modified program, reentered from Debug:

```
-a 0100
0930:0100 db 0
0930:0101 push es
0930:0102 mov ah,[61a8]
0930:0106 mov bx,b800
0930:0109 mov es,bx
0930:010B mov cx,7D0
0930:010E mov al,f
0930:0110 mov si,0
0930:0113 es:mov [si],ah
0930:0116 es:mov [si+1],al
0930:011A add si,2
0930:011D dec cx
0930:011E jnz 113
0930:0120 pop es
0930:0121 retf
0930:0122 ENTER
```

The first added here was a DB pseudo-op before the code. The DB operates much like the DW, except that it reserves one byte per argument. The second thing added was a PUSH ES to save the contents of the ES register in the stack

for the return to BASIC. All segment registers must be restored when the assembly language code returns to BASIC. The next change was MOV AH,[61A8]. This instruction moves the data from location 61A8 (25000 decimal) into the AH register. Recall that AH holds the byte to be stored on entry. The POP ES restores the contents of ES before the return to BASIC. The last thing added was an RETF instruction so that the assembly language code becomes a true subroutine. The RETF here is different from the normal RET used in Debug; it's a "Far" Return, indicating that both the CS register and offset address must be retrieved from the stack. The call from BASIC was located out of the BASIC data segment and was a corresponding "Far" call that changed the CS register in addition to specifying an offset within the new code segment.

The next step is to Dump the machine language from Debug so that we can see what bytes to store in the BASIC DATA statements. The relevant portion of the Dump looks like Figure 4.

We can now put the code into BASIC DATA statements as in Figure 5.

When this program is executed, you will see data appearing so fast on the entire screen that you won't be able to make out individual characters. Contrast this with the speed of BASIC!

The CALL Statement

The CALL statement in BASIC actually transfers control to the assembly language code. Normally the CALL can be used with any number of parameters. The parameters are passed to the assembly

language program via the stack, which both BASIC and the assembly language code share. Here, though, we've used a "parameterless" CALL that simply calls the assembly language code. We've passed the parameter by defining the first location of the assembly language program as a mutually agreed upon location to hold the character to be displayed. The CALL actually calls the assembly language code one byte after the parameter. If this were not done, the 8088 would attempt to execute the parameter value, which would probably be a garbage instruction.

Position Independent Code

A word of warning is in order. Not *all* Debug assembled programs will be able to be incorporated into BASIC statements as we did here. If you use constants inside the program and MOV them with absolute addresses, those addresses will be wrong when BASIC executes the assembly language program. Here's an example of what we mean:

```
0930:0105 mov ax,010A
0930:0108 jmp 0100
0930:010A db 23
```

The MOV AX,010A assembles as B80901, with the 0901 representing an absolute offset within the current code segment. This offset will be different when the program is loaded into the BASIC data area. Conditional and unconditional jumps are "position independent," however, as they assemble relative to their location and do not include absolute addresses for jumps that are close. There are tricks to get around this limitation, but that's another column.

In Summation

In 8,000 words, we've touched on assembly language in the Tandy 1000, 1200HD and 2000, but left out a great deal of material! I hope this has given you the flavor of what's involved, however. It is definitely not for the casual *Lotus 1-2-3* user, but can be very rewarding if you're willing to spend the time in training. I am currently finishing a complete course with text and software for assembly language on the Tandy 1000, 1200HD and 2000. For more information, write me at P.O. Box 3568, Mission Viejo, CA 92692. Next time we'll be back with less esoteric topics, perhaps describing in detail how to turn on your system and set the clock.

Palette Animation

With Wayne Sanders, Curator

This month's featured exhibit is the work of William Fronek of Houston, Texas.

The program, called WAVE.BAS, simulates computer animation with clever use of BASIC's PALETTE command.

It runs on either a Tandy 1000 or a Tandy 2000 with graphics. If you will be using it on a Tandy 2000, change the first line to read 1000 MODEL=2000.

If you have a creation you'd like to see presented here, by all means, send it in. A winning gallery exhibit is chosen each month, and the "artist" is awarded \$50. Address your entries to Wayne Sanders, PCM Gallery, P.O. Box 385, Prospect, KY 40059. You might find it well worth the effort!

The listing:

```
1000 MODEL=1000
1010 IF MODEL=1000 THEN CLEAR ,,,32768!:CLS:KEY OFF:SCREEN 5:R=.5
1020 IF MODEL=2000 THEN CLS:KEY OFF:SCREEN 3:R=1
1030 C=1
1040 FOR I=10 TO 150 STEP .3
1050   Y=200-195*SIN(I)
1060   X=10+I*4
1070   CIRCLE (X*R,Y*R),4*R,C
1080   PAINT (X*R,Y*R),C
1090   C=C+1:IF C>7 THEN C=1
1100 NEXT
1110 FOR C=1 TO 7
1120   PALETTE C,12
1130   FOR T=1 TO 120:NEXT
1140   PALETTE C,0
1150 NEXT
1160 GOTO 1110
```

PCM

PCM introduces a new monthly column
that helps you put Tandy's DeskMate to work

The Integrated Desk

By Bobby Ballard

Welcome to PCM's new *DeskMate* column. You will find important information and interesting tidbits here each month to help you get the most from your *DeskMate* software. I'm excited to bring you this column and I think you will find it useful whether you're a beginner or an advanced computer user.

As you may know, Tandy distributes *DeskMate* with every new Tandy 1000 and 4D. Versions are available for other models, such as the 1200, 2000, Model 4/4P and Color Computer. I will concentrate in this column on the MS-DOS versions of *DeskMate* for the 1000, 1200 and 2000; especially the 1000 since everyone receives a copy of *DeskMate*.

I encourage you to write me with your problems, suggestions or questions about *DeskMate*. Let's face it, no manual completely covers all the subjects or questions a person may have with a particular piece of software, and *DeskMate* is no exception. And in this case, an integrated package, there can be many questions about each feature. So, don't hesitate to write and share your thoughts or problems.

(Bobby Ballard is a free-lance writer and the owner of a computer software and consulting firm. He also operates a BBS in Brooklyn. Bobby can be contacted at 1207 Eighth Avenue, Apt. 4R, Brooklyn, NY 11215.)

Integrated Versus Dedicated

DeskMate might have been your first experience with an integrated software package. If so, let me help you get a grasp on the difference between integrated and dedicated software and what they mean to your productivity. After all, you bought your computer to be more productive, right?

When you see the term integrated software, it can sometimes have various connotations. Most of the time though the term is applied to programs that combine features traditionally found in separate packages. In the past, if you wanted to process words, you bought a word processor or editor of some type and used it for just that task. Then, if you needed to file some information, you would load a database program, set up your files for whatever type of data you needed to keep track of and then file it. There are many historical reasons for the separation of these tasks, but the main one is memory capacity. These separate but equally powerful programs are known as dedicated applications.

As the industry moved toward more memory at lower cost, programmers were given the ability to combine different features in one program and to make those features interactive. In the past, you might not have been able to combine a letter with your files unless the two programs could "talk" to each other or you bought a program to make them interactive. This combining of features is known as integrated soft-

ware, and that's the category into which *DeskMate* falls.

DeskMate packs many features and a lot of power for the money spent. Although the names have been changed, the tasks are essentially the same. You get a word processor in the "Text" section to handle your writing needs. The "Worksheet" section is a 99 by 99-cell spreadsheet for performing complex calculations and "what if" functions. "Filer" is a database manager that will not only keep track of your data, but allow you to combine your data with the "Text" feature using a merge function. The "Telecom" feature is a telecommunications package that handles dialing the phone, "auto-logs" and the protocol settings for using a modem to send and receive data over the phone lines. The "Calendar" feature provides time management software that works with the "Alarm" feature to warn you before the event is about to happen. The "Mail" feature provides a way of receiving files over the phone lines while leaving your computer unattended. This works in conjunction with the "Host" mode found on the single-line menu at the bottom of the main menu.

In addition, *DeskMate* provides a simple calculator, on-screen help files, an alarm file editor, voice phone dialing, data and time functions and printer settings modification. Each month I'll cover one of the many and varied features found in *DeskMate*, weed

"While you may be able to write a letter, merge it with a spreadsheet and then send it out over the phone lines to others, you will find trade-offs for the convenience."

through the manuals and help files and pass on tips that *you* have found and sent in to share with others.

You must remember that integration has its drawbacks. While you may be able to write a letter, merge it with a spreadsheet and then send it out over

the phone lines to others, you will find trade-offs for the convenience. What are those trade-offs? Let's take a look.

The first obvious drawback is the size of the files with which you can work. For example, when you go to download using the "Telecom" feature, you will be limited by the size of the buffer you have in which to capture data. With *DeskMate*, the buffer is only 17K or about 17,000 bytes. Each character received takes a byte so your files will have to be no longer than several pages of single-spaced data. Some quick calculations reveal the details. If the average word in the English language is five characters in length, and you allow for control characters as well, you can only download about 3,000 to 3,400 words. At 1200 Baud you receive about 24 words a second. At that rate you will fill your buffer in about two and a half minutes. At 300 Baud you will fill your buffer in just under 10 minutes.

A second drawback is limited features. You will notice, especially if you've worked with other software, that many features of dedicated programs are not found in *DeskMate* applications. To give another example, the word processor in *DeskMate* does not

have global search and replace or a spelling checker, and the scrolling becomes slower the fuller the buffer gets. These are small trade-offs to be able to compose mail and send it over the phone lines or merge letters with spreadsheets and files, but these trade-offs may be limitations you can't live with and will want to buy dedicated software for some of your applications.

I point out these things not to degrade *DeskMate*, but, to give you an idea of why some features work the way they do. I think that no matter why you bought a computer, you will still find a task that *DeskMate* will handle excellently. While I use my 1000 mostly for word processing and programming, and the "Text" feature doesn't contain all the features I need, I still find the spreadsheet as well as the Calculator and Filer meet most of my needs, and I make heavy use of the "Calendar" feature. In addition, I consistently log on to CompuServe, Delphi and the other databases using the "Telecom" function.

The above leads me to the major advantage of *DeskMate* and integrated software. With one purchase, you get the major applications needed to get a day's work done efficiently. In other words, you get the tools needed to increase your productivity. It would be an expensive proposition to buy all the dedicated software needed to achieve the variety of tasks that *DeskMate* makes available. Imagine the cost of buying a word processor, spreadsheet, telecommunications package, calculator, database and the others that make up *DeskMate*. You would need hundreds of dollars — and some new shelves for all the manuals.

DeskMate allows you to get a grasp on your own needs beyond the tasks you may already be planning to perform. While you may have bought a computer to write or perform calculations, it would be a shame to exclude yourself from the other tasks a computer can perform because of the high cost of dedicated software. With *DeskMate*, you can perform those other tasks without the extra expense.

Additionally, you can find out more about what a computer can do and the features you need in your dedicated programs before you buy. I know many people who bought a computer to use for one specific task, but when they got an integrated package or talked with friends, they found they could perform tasks that were valuable to them and valuable to making better use of their

machine. For example, you can log on to a BBS or information utility and find out how to make better use of *Lotus 1-2-3* without having to spend several hundred dollars for a dedicated telecommunications program.

To sum it up, each section of *DeskMate* has something to offer everyone. Don't look at what *DeskMate* can't do with your specific needs but how *DeskMate* can add to your overall computer power and productivity.

If you're like I am, you bought a computer to run a particular piece of software, and now you've found that it can do much more than you planned. *DeskMate* will give you an idea of what

you can achieve with your computer. So, if you find that you would like to know more about spreadsheets or telecommunications or any other feature of *DeskMate*, just stick with PCM and this column. We're going to cover the whole range of possibilities using *DeskMate* from word processing to auto-dialing and using your computer to host other computers. I'll cover the technical as well as the general aspects of *DeskMate* and try to answer your questions, pass on tips from other readers and put *DeskMate* through the paces. Just as *DeskMate* is an integrated software package, we'll integrate many subjects right here in PCM.

PCM

NEW CUSTOM SOFTWARE for your MODEL 100 or NEC PC 8201A

CBUG

CBUG is the ultimate debugging utility for your lap computer. Requires less than 3K RAM. 100% machine language. Features include:

- Instruction Step
- Call/Instruction Step
- Zero/Fill Memory
- Load Data
- Alter Registers
- Dump Memory & Registers
- Search/Replace
- HEX math (+ & -)
- Decimal — HEX conversions
- Display in HEX or ASCII

\$29.95

RENUMBER

The utility you've been waiting for! Now you can renumber your BASIC programs IN PLACE! This powerful, 100% machine language program is relocatable to any convenient place in memory. Requires less than 3K RAM. Renumber all or part of a program. You specify line numbers and increment.

\$24.95

LET'S PLAY MONOPOLY*

It's you against the computer and the computer is a tough competitor. Super fast machine language graphics display the whole board at all times. The computer makes all its own decisions. You're really going to love this game.

\$29.95

ASSEMBLER

A powerful 8085 assembler for your lap computer. Recognizes all the standard pseud-ops. Immediate data may be in decimal, hex or ASCII. Relocatable to any convenient place in memory. Several built-in Macros make your programming easier. FAST! Written in 100% machine language and requires less than 3K RAM.

\$32.95

MELODY MAKER

A musical program generator. Use simple cursor controls to enter sheet music. Melody Maker writes a program to play the song. You can even use Melody Maker to add musical routines to your own programs.

\$19.95

This BASIC program turns your Model 100 into a BBS host

Host Your Own Network with Your Model 100

By Chuck Buchanan

“You’re joking! Run a BBS on a Model 100? Who ever heard of such an idea!”

Those are the initial reactions of most people in Spokane until told that for the last nine months I’ve been running a very successful BBS on a 24K Model 100 in conjunction with an auto-answer modem and a separate phone line. It’s a fantastic way to keep in touch with friends and associates and not have to play “telephone tag” with one another in order to do it!

The Model 100 has to be the most capable and dynamic little computer to come down the pike in a long, long time; it is only natural that it be considered for a BBS system! This article will describe just how to go about setting up *your* system. As for me, all I can say is that telecomputing has become so easy and so much fun that I’ve had to buy

(Chuck Buchanan is a self-admitted “computer addict” who uses micros in both work-related contracts management and hobby applications. He developed a passion for programming in BASIC with his first computer [a Color Computer] four years ago.)

a *second* Model 100 for general use, and I am now using the first one exclusively for full-time BBS operations. So beware!

What It Is

The network, called “SoftMail,” is a full-featured BBS that allows up to 30 members to “message” each other day and night. It features full password access and message privacy; while new callers may simply enter NEW as the password and be directed to an area where they may leave an inquiry, regular members have three tries to give their own private password in order to log on.

Once successfully “in,” callers have the ability to check for messages, to review the address list, to edit and send messages (with automatic line wrap), to receive mail, to page and enter a “chat mode” with the SysOp (that’s *you*, the system operator) while online and to log off with an accounting of how long they were connected. A help feature is also included, which will use the text file you may write and place in RAM as ALL01Z.DO.

The menus within SoftMail are easy, self-explanatory and only require touch selection. For the SysOp, there are extra features. Four function keys allow him or her to enter chat mode at any time with the caller, interrupt program execution and give a “host off” message, provide a warning that the system will go down in two minutes and simply have the screen show who is online.

SoftMail keeps a full record of who called, the date and time, how long they were online and what messages they retrieved, sent and deleted. This record, called SYSDFZ.DO, can be reviewed remotely by the SysOp. In addition, the program features full error trapping and will even “kick” persistent error makers off the system!

During menu input, SoftMail will convert lowercase to uppercase so that there will be no errors in command or file recognition. In the event of a “sleepy” caller who dawdles more than two minutes without doing anything, the BBS will even hang up automatically and reset itself.

Unlike other remote BBSs, which allow the caller’s keyboard to duplicate

the host's console, SoftMail treats external input/output as a remote file, and the BASIC BBS program stays in full control at all times, with the host's LCD screen only showing significant menu selections and input as the caller writes messages.

But It's So Small

Now you ask, why network with a 100?

There are a number of reasons why the 100 is a *perfect* choice:

- Because it has no moving parts to wear out, no disks to replace; all messages (and the hidden log file SYSDF) are maintained in RAM, designated as BBS files by the suffix Z.D0
- By using the INPUT\$ command for all input, the system is able to avoid sabotage or interruption through a hostile CTRL-C or BREAK command invoked by a caller.
- The size of the 100 makes it highly suitable for applications which need a full BBS without wanting to have to

endure the complexity and size of other systems.

- Because everything is in RAM, it is instantly accessible for review by the SysOp. Responses can be written from the host side by simply using the text program (inserting carriage returns) and labeling the messages with titles that the BBS can recognize.
- Since it is a non-mechanical system, there is no need to fear a "runaway" computer — disk drives smoking into oblivion. Using the IPL feature, the BBS can even survive power outages.
- Finally, it's just plain fun to have so much going on so simply in such a compact little package!

Getting It Together

Type in the program and save it as BBS.BA.

Using IPL, instruct your 100 to execute BBS in case of power interruption. Create a message similar to that in "Message 1" and save it to RAM as ALL01Z.D0. This is the message that

will be listed to the caller if he or she selects HLP from the menu. It will also be listed from within the BBS directory (CHK) and may be retrieved in that manner as well.

Be sure to set up your caller and password files in lines 1000 through 1004, being sure to follow the designated format (a two-digit number for the member, one space, the member's name, followed by a comma and then the three-letter password for that member). You may also wish to adjust GOSUB 80 to include the commands your particular modem requires to disconnect the phone when you log off or receive a "denied access" message. Furthermore, Program Line 4 is optional and only serves to initialize a modem; you may want to delete it if you don't need it.

Connect an auto-answer modem to the RS-232 port. Important: set your modem for non-verbose, "quiet" mode with no echo and with auto-answer enabled. Plug everything in and run the

program. After a few seconds, you'll hear a beep, the screen will clear, show the current files, state *Awaiting at:*, the setup (or reset-up) time, give the current memory space remaining and (once you've had the first caller) show the name of the last person online.

When someone calls (try it) they'll be prompted to press an asterisk (*). This gets things going — the host screen will say *BUSY* and the four function key options will be displayed. They will then be asked for their password and will be sent to the main menu. A special memory peek technique allows for a review of BBS-related mail. When the caller presses *C* for checking mail, he or she will be shown the messages that are BBS files.

The program only displays messages (files) with the flag of *\$\$\$##Z.DO*. BBS messages always follow the format of the left three characters matching the caller's name or initials and the next two characters being digits representing the message number. The caller never sees the *Z.DO*, as it is always added discretely by the system.

The special log file *SYSDFZ.DO* is not displayed, but the SysOp always knows it's there, and can retrieve it from a remote location (and erase it to restore memory) at any time. If the thought of a RAM-based log makes you nervous, simply hook up a printer and change Line 11 to:

```
11 OPEN "LPT:" FOR OUTPUT AS 4:
RETURN
```

The SysOp file symbols are: *#* — who called and when; *<* — messages retrieved; *Ø* — erased or *>* — sent and *=* — log off with usage time. An *nle* entry indicates a denied access situation, and *time* means the caller got disconnected by the BBS due to overdue input. A *?* denotes a BBS error recorded, and a *[i]* indicates that the program incurred the same error twice

Message 1, Sample ALL01 help file

Welcome to the Model-100 EBBS, providing 24 Hour/Day Communications Networking!!

SoftMail is now running on a

< TRS Model 100 !! >

For MENU Selections you need only PRESS the KEY; do NOT use <enter> unless entering Mail Titles or inputting numbers.

Use Ctrl-S to Stop Display:
Ctrl-Q to Start again. . .

Throughout, the AT Key <@> functions as an ESCAPE Key -

You may press <@> at any prompt and you will go to the PREVIOUS Menu. From the Top Menu, the <@> will log you Off.

Use <Chk> to see if you have any MAIL; if so, the Title's LEFT 3 Letters will match those of your Name or Initials.

Enter that plus the two Digits.

Please be sure to Log Off before hanging up. . .

Happy Telecomputing !!!

Sincerely,

Your Friendly Local SysOp!

and started all over. This will probably only happen if some "clever" caller tries to zap you with a CTRL-Z.

Callers may write to anyone but can only retrieve their own messages or those addressed to "all." The SysOp, however, can retrieve and delete anything. Furthermore, while anyone can originate an "all" message, only the SysOp can delete one.

The edit features of the BBS are fun — play with them! They will allow a line-by-line review, adding a line, editing a portion of a line and deleting a line. Once a person elects to return to

the main menu, they are asked if they want to send the message. They may answer either way; if they do not send it immediately, they may go back down to the work desk at a later point and send the message then, or they may start another message.

If you have a Disk/Video Interface, you may wish to expand the BBS to include other services, related programs which could be on disk and chained online. For example, my current BBS features access to any number of Adventure games which callers may dial up and play. ☐

The listing:

**Our new Interface Card lets you
connect your MS-DOS computer to the
outside world to control and monitor
devices and instruments**

The BG-Board Interface System provides buffered access to the control, data, and address buses of the computer. Specially designed CableCards orient the signals to and from the BG-Board and many popular computers. The new BG-119 CableCard brings the MS-DOS machines into the fold with the previously available CableCards for the Model III/4, Apple II, Commodore 64, and VIC-20. Our new catalog describes the system and more than 100 books on interfacing, electronics, and personal progress plus some scientific and utility software that can simplify data analysis and computer performance. Write or call for it and the special sale now in progress. 703-651-3153

Super Utility

for PC/MS-DOS™

Fixed/Floppy Disk-Tools for IBM PC™, XT™, AT™, Tandy 1000, 1200, 2000 and other compatibles.

Data file recovery, disk exploring, zapping, and MUCH more!

Accidental deletions and disk directory problems can happen to anyone at anytime... a power spike, fingerprint, speck of dust, hardware problem, or simply typing DEL ** in the wrong sub-directory can destroy critical data in a moment without warning. Therefore we introduce **Super Utility** for the PC - an easy to use disk utility containing many functions sorely needed in today's PC/MS-DOS computing environment. *It's really great!*

With **SU/PC** you can restore damaged or deleted files using two different methods (one very easy, the other a bit tougher). Even clusters of an erased file assigned to another file can still be restored, unless the user has physically written over every byte of the original data (most applicable with word processing files).

In addition to file repair and recovery, **Super Utility** provides sector verify, sector editing, modification of sectors in Hex or ASCII, ease of renaming of files and setting their attributes (lock and unlock files, etc.), string search, copying sectors to a file, diagnostic sector checking, mapping of the FAT table of a file or an entire drive, visual graphics pertaining to your system, and full directory and sub-directory editing without endless menu-hopping - all in one program. Want to change the name of your sub-directory without copying all your files to a new one? Just retype a new name over the old one with **SU/PC**! The sector display mode displays all 512 bytes on-screen at one time and allows you to fully explore your disks. SEARCH and CHANGE are nice here too! Will find any occurrence of a byte or string on your disk. Compatible with DOS versions 2.0 - 3.1 on most systems. Some computers may require the use of PC-DOS. Color, composite, or monochrome video are supported. A great tool for fixed disk users as well as floppy. Also compatible with IOMEGA's Bernoulli Box™ storage device (soon to be distributed by Tandy as the Disk Cartridge System). Easily the most **POWERFUL** PC/MS-DOS disk utility available today. Please do not confuse the MS-DOS version of **Super Utility** with the TRS-80™ version. **Super Utility for MS-DOS is NOT SU+ from the TRS-80 "ported over".** **SU/PC** is a totally new program that fills the gaps that PC users have most need of and have asked us for. It's aimed at the beginner, the "office user", hobbyists, students of the PC, or programmers alike.

So, why not be certain about the safety of your data (and your peace of mind) when you can have **Super Utility/PC** disk insurance right on hand at an unusually low price? Make your new computing life easier, more fun, and knowledgeable all at the same time. Unprotected media.

• Introductory Offer •

Super Utility/PC

only **\$89.95**

POWERSOFT

17060 Dallas Parkway, Suite 114
Dallas, Tx 75248 • 214/733-4475

Prepaid or charge card orders (only) include free UPS shipping to US addresses! Blue label, COD, or over-night shipping available at extra charge. Visa-MasterCard accepted. Introducing a new monthly column for you and your Tandy PC

Making Magic with DOS Menus

By John B. Harrell, III

Welcome to PCM's new Tandy PC forum — DOS Boot. In this column, I will explore avenues that will allow you to use the full power of these magnificent machines.

I'll start off this column with the first of a two-part article on using menus to run your applications. The menu program contained in the first part makes the most complex applications as easy to run as pressing a single key. The second part will contain a simple installation that makes changing your menu features a snap.

Why Menus?

This is a reasonable question and deserves an answer. *Menu* was born out of sheer frustration. I set up a multiple-computer installation in my office and encountered two problems immediately. First, someone accidentally formatted one of the hard disks (yes, it was fully loaded!) and, second, everyone kept asking me how to run so-and-so. When the second hard disk unit

(mine) was inadvertently erased, I had had enough!

My first attempt at automating this process was to set up a simple menu using a batch file. Have you tried this? It is really *slow*! You also have two other problems. If you scroll the menu off the screen (display a directory, for example), how do you get it back? Also, if you leave it there for extended periods of time, it may ruin your monitor.

I devised *Menu* as a means of protecting the systems and to make it easy for anyone to walk up and run any of the applications on the computer. You can run *Lotus 1-2-3*, *WordPerfect*, *Graphwriter*, etc., all with one keystroke. This is not bad when you consider that my hard disk has 658 files taking up a total of 9 million bytes and using 24 sub-directories.

Menu Magic

Menu is really the most important of three parts of this system that makes it so easy. It is the driver program which interprets your request and executes the correct application (Figure 1 is an example of my system display). *Menu* also allows you to format a disk, to exit to the MS-DOS command level, and will blank the screen after a user-defined period of inactivity.

Menu requires proper installation in the system and this is done by the AUTOEXEC.BAT file when you are boot-

(John B. Harrell, III has written for microcomputer magazines for three years. He holds a bachelor's degree in computer science and is a software technical expert for Navy electronic support measures systems.)

Figure 1: Example Menu Screen Display

J. B. Harrell's IBM-PC/XT Selection Menu	
A. Run LOTUS 1-2-3 Spreadsheet B. Run LOTUS 1-2-3 Access Manager C. Run D.P.E.N Access Integrated System D. Run the SYSTEM/36 5250 Emulator E. Run WordPerfect Word Processor F. Run DisplayWrite 2 Word Processor G. Run MultiMate Ver 3.30 Word Processor H. Run GraphWriter Business Graphics I. Switch output devices for LOTUS graphs J. Format a floppy diskette in drive A: K. Exit to the MS-DOS command level	
DD/MM/YY	Press a letter key for your selection HH:MM:SS

ing the system. Figure 2 is an example of my IBM PC AUTOEXEC file. Notice that it loads several programs which remain resident and MENU is the last to load. This is important. Make sure nothing is loaded after MENU that will remain resident when that program terminates.

Another key part of the AUTOEXEC file is the PATH statement. This statement establishes the search path used by MS-DOS when it attempts to execute files. Note the subdirectory named \DOS\BATCH — this is where I put all the batch files linked to MENU.

The last part of the menu system is the batch files. These files are named corresponding to the letter of the option selected. Figure 3 shows batch file A.BAT which executes Lotus 1-2-3 from the menu. Note the simplicity of the batch file: the CHDIR or CD commands specify the directory to be used. Don't forget the leading backslash (\) as the batch file may not be executed from the root directory, and the last command selects the root directory.

Look again at Figure 1. I reserve the last two option letters for formatting a disk and for exiting to MS-DOS. Press-

ing the letter corresponding to the FORMAT option will present a secondary option which allows you to select a data disk or system disk format.

Pressing any other key than these two options will instantly return you to the menu. Selecting either option will automatically run FORMAT and prompt for a new disk to be inserted into drive A. This is predominately for hard disk users and I will talk about changing this option later.

Similarly, the last option is reserved for exiting to the MS-DOS command level. With one minor restriction, this is

Figure 2: Example Menu Option Batch File

```
echo off
cd\123files
123
cd\
```

Notes:

This menu batch file corresponds to Option 'A' on the sample menu and will load and run Lotus 1-2-3 without going through the "access" manager.

1. The echo off command is used to suppress listing the remaining commands in the batch file.
2. The cd\123files command is used to change to the Lotus sub-directory — the leading '\' is used to make sure that MS-DOS can find this sub-directory from any other directory.
3. The cd\ command should terminate all batch files to return the system to the root directory at the end of each application.

Figure 3: Sample AUTOEXEC File

```
echo off
date
time
path .;e:\dos;e:\dos\batch;e:\dos\util\myown;e:\dos\util\others
prompt $e[1m{$t$h$h$h} $p$g$e[0m
mode com1:9600,n,8,1,p
spooler 63
cd \dos\sk
sk
cd \
menu
```

Notes:

The sequence of operations must set up the environment (prompts and paths) and load all memory-resident software prior to loading MENU:

1. The PATH command establishes search areas of \dos, \dos\batch, \dos\util\myown and \dos\util\others for MS-DOS.
2. The PROMPT command uses a mixture of "prompting" characters and ANSI .SYS control codes to display the time, path name and '>' prompt in high intensity video mode.
3. The MODE, SPOOLER and SK commands load all memory-resident software prior to loading MENU.

just as if you had booted the computer and were at the first C> prompt. The restriction is that there is a limitation on changes which may be made to the current environment variables. If you are not familiar with this concept (see your MS-DOS reference manual), then don't worry about it. I have encountered few software packages that conflict with *Menu* in this regard.

Answer the prompt with anything other than a Y to exit to MS-DOS and you will return to the menu immediately. Once you are at the MS-DOS prompt, you can instantly get back to the menu by typing the MS-DOS command EXIT and pressing the ENTER key.

Pressing any other option letter displayed on the video screen will load a new version of COMMAND.COM and execute the batch file with the same name as the letter pressed. For example, pressing the letter E (upper- or lower-case) will execute E.BAT which expects to find commands telling the system how to load and run *WordPerfect*.

Once you have finished with the application, use the normal exit procedures just as if you were returning to MS-DOS. The batch file will then execute the remaining commands. When COMMAND.COM realizes that there are no more MS-DOS commands in the batch file, it will terminate and automatically return you to the menu for your next selection.

Should you desire to quit for awhile, don't worry about the bright menu display "burning" into the monitor. At

the end of the selected "time-out" period, *Menu* will turn off the monitor with the exception of a flashing prompt reminding you to press a key to return to the menu. While the menu is displayed, the current date and time are displayed for your convenience.

Creating Your Own Menu

This involves two parts. The first part creates the program file MENU.COM. Enter the program contained in Listing 1 and then run it. If it displays an error message, check the DATA statements carefully for typographical errors. If no error messages are displayed, MENU.COM has been created. Type MENU and see the splendid display.

The second installment of this column will give you the menu installation program. This provides an easy mechanism to set the colors you desire and allow you to set the menu option text. Until next month, you can use *Menu* just as it has been created by writing your batch files and using the options with the text displayed.

A Real Good Deal

If you can't wait until next month for a fully operational menu, send me a disk in a mailer with the proper return postage. I will send you a disk with MENU.COM and MENUSINT.BAS on it. I will also configure this disk to be a fully operational system, including sample batch files and demonstration applications.

As published, MENU.BAS only runs on

the Tandy 2000. *Menu* will run on all IBM PC computers and compatibles.

If you would like a version for your Tandy 1000 or 1200, follow the same instructions as above. Make sure you specify what computer you will run it on. Tandy 1000 users note: install the software for a color monitor *even if you have a monochrome monitor*.

Please send your disks and pre-paid mailers to LCDR J. B. Harrell, III, 1519-A Carswell Circle, Bolling Air Force Base, Washington, DC 20336.

Finally

You will find *Menu* useful for rapidly changing from one application to another *even if you don't have a hard disk*. If you do not have the statement BREAK=ON in your CONFIG.SYS file, there is no way to exit *Menu* without resetting the system. A simple CTRL-C will suffice to exit if break is enabled in the configuration file.

While you are packaging up your disks, take a few minutes and let me know what you would like to see in this column. Some of my ideas are to investigate the MS-DOS commands available to you as a programmer, explain how to manipulate high resolution color graphics and text, an explanation of how monochrome text mode really works, and to make a comparison of Tandy 2000 compatibility to the IBM PC from a programmer's point of view.

Even if you don't send me a disk, drop me a line anyway. I'll be looking forward to your comments. □

The listing:

Introducing MFB-1000™

DMA Controller
(Available without DMA Controller to use
as second board or for IBM compatibility)

Designed for use with the new Tandy 1000 Personal Computer, the MFB-1000 contains three of the most needed functions on a single 10" expansion card. Using either 64K or 256K DRAM chips, the MFB-1000 can be populated with up to 512 K of memory bringing total system memory to 640K. Additionally, the board also includes an IBM compatible serial communications port (identified as COM1) and a battery backed real time clock/calendar. As required by the design of the Tandy 1000, the MFB-1000 also contains its own DMA Controller. However, the DMA Controller can be disabled, making the MFB-1000 compatible with the Tandy 1200 as well as other IBM compatible machines.

**MSDOS UTILITIES
TANDY 1000, 1200, 2000
IBM PC/XT/AT**

******* RAMDISK *******

\$49

RAMDISK -- Use spare memory as a superfast disk to speed up applications. (You specify Ramdisk size). Appears to programs as a disk, but gives instant access. Easy to install and use.

******* USER TOOL BOX *******

\$59

SINGLE KEY COMMAND -- Define any text string (or DOS Command) as a single keystroke. Press single key to execute commands!

ALPHABETIZED DIRECTORY DISPLAY -- View Directory on 1 screen (5 columns, sorted, Fast!).

FIND FILE -- Search all directories for file.

DIRECTORY DTREE -- Display all sub-directory names in an easily readable form.

CHANGE FILE ATTRIBUTES -- Make files hidden, readonly, archive, etc. Set or reset attributes.

******* FULLBACK *******

\$88

Finally, an easy to use backup program that keeps exact images of your files on backup floppies, cartridges, or hard disk. Automatically backup one, several, or ALL subdirectories. Backup modified only, or ALL files. Keeps perfectly organized backups - backup structure is identical to original. Supports backup by date, multiple backup copies, large files (up to 32MB). Far superior to DOS BACKUP, easier to use, and much more reliable. Absolutely a **MUST** for hard disk users.

******* SNAPSHOT *******

\$59

Instantly snap an image of your screen for later recall. Simple keystroke combination to save or recall screen images before they disappear forever. Save and load from a file. Available from DOS and applications.

More ALPS Tools Available. Call or Write for ALPS catalog. Customer Support !!!

Micro to Micro . . . to Mini . . . to Mainframe! TELETERM DOES IT ALL . . . BETTER!

FEATURES:

• **TERMINAL EMULATION**

of more than a dozen terminals including:
DEC VT100, TRS16, ADDS25/VIEWPOINT, TELEVIDEO and many others.

• **ELECTRONIC MAIL** - has all the features necessary to access Western Union's Easylink, ITT Timetrans, RCA . . . Word Processing, Direct File Transmission, Mailbox Retrieval To Screen, Printer or File.

• **FILE TRANSFER**

Powerful error-free disk-to-disk file transfer capability --without any memory buffer limitations --is another. Transfer contents of an entire disk if necessary. Even converts files from MS-

DOS to TRS-DOS or XENIX systems format or vice versa when TELETERM-EM is paired at both ends.

• **UNATTENDED OPERATIONS MODE** - permits automatic sequential dial up and connection to other systems, file transfer between systems, including mainframes, and log-out any time of day or night. Receives and collects data, commands from others any time as well.

Integral text editor provides word processing capability.

TELETERM-EM does all this --and more.

See it for yourself today. At the Radio Shack near you. Or phone or write us direct. Telepress, Inc. P.O. Box 217, Willingboro, NJ 08046 (609) 877-4900.

Submitting Material To PCM

Contributions to PCM are welcome from everyone. We like to run a variety of programs which will be useful/helpful/fun for other Tandy Portable and MS-DOS computer owners. We now support the Model 100, the Tandy 200, and the Tandy models 2000, 1200 and 1000.

Program submissions must be on tape or disk, and it is best to make several saves, at least one of them in ASCII format. We're sorry, but we do not have time to key in programs. All programs should be supported by some editorial commentary explaining how the program works. Generally, we're much more interested in how your submission works and runs than how you developed it. Programs should be learning experiences.

Pay for submissions is based on a number of criteria. The rate of remuneration will be established and agreed upon prior to publication.

For the benefit of those who wish more detailed information on making submissions, please send an SASE to: Submissions Editor, PCM, P.O. Box 385, Prospect, KY 40059. We will send you comprehensive guidelines.

Please do not submit programs or articles currently submitted to another publication.

If you feel qualified to review software and/or hardware products for computers covered in PCM, send us your name, address and phone number; we will send you a questionnaire form and a copy of our reviewer guidelines.

MEET THE WIZARD™

Quality / Price / Performance Guaranteed

Easy to use! **\$29.95** for any one package

9.95 for each additional

For TANDY 1000, 1200, 2000 and Compatibles

- 1. UNDELETE Plus** — Recover deleted files, display sorted directory tree, rename directories, cross directory file search, quick sort directory display, change file attributes, and **more** (8 programs in all).
 - 2. SHRED** — For your Security needs. Put your confidential files through the Shredder and even the Wizard can't restore them! Confidentiality guaranteed.
 - 3. RAMDISK** — Transform your spare memory into superfast disk(s). You specify size and number.
 - 4. SNAPSHOT** — Instantly save and display up to 99 text screen images. Great for debugging, Help screens, etc.
 - 5. SHERLOCK** — Find lost files. Give Sherlock a clue (eg phrase or fragment of file contents) and files will be located in all directories.
- **For Okidata, Epson and compatible Printers****
- 6. GRAFIX** — Send graphics screen image to printer. You choose printout size.
 - 7. FONTFIX** — Send control codes to printer to configure output mode. Easy to use mnemonics.

PCM

MAI Accounts Payable: An Easy-to-Use AP Program

Software

2000

MAI's *Accounts Payable* program makes the chore of paying bills a little easier. The software can be operated separately or as an integrated part of the MAI accounting system. A Tandy 2000 with 128K RAM is required, one or two floppy disk drives and a printer with 132-column width.

Several Tandy printers are accommodated, but at present there is no way to configure the printers. MAI is working on printer drivers and will send the update free to registered users. I used the Line Printer VI, but even with 132-column paper, some of the printouts went off the right-hand edge of the paper. If you put your printer in condensed mode, everything will print on the page.

The software accepts either cash or accrual accounting, has a consistent debit/credit balance with automatic control during data entry and allows posting to once-only vendors. If interfaced with the *General Ledger* program, payments and invoices are posted to the proper accounts, and a posting distribution report is generated.

The discount due date, discount amount and invoice due date are calculated automatically. Safeguards are installed to protect against duplicate invoice payments. Editing and data verification are done online, and discounts are recorded in advance or at time of invoice payment.

Either partial or full payment of

invoices is allowed, and file sizes can be expanded in mid-year, based on account activity. An aged open invoice report is printed by invoice received date or by due date. Full details or a summary can be shown.

A special feature of this software is password protection to restrict access to any menu. The data entry operator could post invoices and generate vendor labels, but could be restricted to printing checks.

Forecasting the cash requirements is shown by month, or by user-definable number of days per period. Invoices are selected for payment based on invoice due date, vendor, pay cycle or any combination of the three.

The system accepts up to 200 vendor accounts and 2,000 open invoices, with 10 percent disk space left over and mailing labels for vendors are generated by the program.

The main menu is simple and easy to understand. The choices are 1) definition — to personalize the system, 2) system — to operate daily entries and 3) utilities — to back up the data. The user manual has a nice flowchart illustration which shows the progress of the program.

The definition option sets up the company name and address, with federal, city and state tax ID numbers. Prompts ask if the company has divisions, uses preprinted check stock and operates on a cash or an accrual basis. Common payment terms such as 2/10 net 30 are predefined with a special two-

letter code. When invoices are entered, the vendor's default payment terms are automatically displayed.

Checks are printed with detailed payment information, and can be drawn on up to 24 bank accounts. Bank ID codes are set up for each account, account numbers are entered, and a general ledger account number can be assigned to each checking account.

Manually written checks can be input into the payables system at any time during the month. Checking accounts are reconciled with bank statements, with provisions for interest, service charges and other adjustment such as credit card fees.

One nice feature is treatment of discounts. If the "discounts assumed" option is chosen, and an invoice for \$100 with two percent discount is entered, the system posts \$98 to the expense account and to open accounts payable. If the discount is lost, \$100 is posted to cash, \$98 to open payables and \$2 to discounts lost.

The retention part of the program allows for partial payments of an invoice. Full payment might be withheld until certain conditions are met, such as completion of work or installation of equipment. During automatic payment selection for any retained invoice, the amount paid is invoice value less the retained amount. If cash, rather than accrual basis is selected, this retention feature is not available.

Vendor codes can be alphanumeric or numeric only, up to six characters per

vendor. If divisional reporting is chosen, the first two characters of vendor code show which division accrued the payable. With this feature, payables and expenses are reported separately by company department.

After the vendor's code, name, address and phone number are installed, an eight-character sort key is set up for each vendor. The program defaults to the first eight letters in each vendor's name, but customized codes can be entered. If you try to delete an active vendor, an error code appears and the program refuses to delete the vendor.

An optional pay cycle can be set up for each vendor. Perhaps you want to pay the landlord on the first of the month, and the telephone company on the 15th. Numbers greater than 31 can be entered for quarterly payments such as insurance.

Vendors can be defined in mid-year, and purchases-to-date, returns-to-date and year-to-date purchases/returns are automatically calculated. The general ledger account most often used with a vendor is set up, and when invoices are posted, the screen shows the account number as a default.

The vendor masterfile listing prints summary reports in alphabetical or vendor code order. Some, or all, of the vendors can be listed. A second report, the vendor detail listing, shows open invoices by vendor. A vendor cross-reference listing which prints on the screen shows vendors by numeric code and alphabetically. This helps control duplicate entries of vendors. Mailing labels are printed for all vendors, or for a selected few. A test pattern aligns the labels.

The invoice entry/check payment

program is simple to use, but has some built-in controls. The vendor code prompt displays a '#' sign for numeric data and a square block for alpha. Up to 10 alphanumeric characters are input for invoice number, and the date can be input or defaulted to today's date. A non-discountable amount, such as freight charges, could be shown, and the prompt for invoice amount shows commas so it's easy to enter the amount. A 15 character memo can be added.

I liked the posting function of the invoice entry feature. Total amount to be distributed is shown on the screen. If the invoice is for \$500 and \$300 is posted to inventory, \$200 appears in the distribution box to show how much is left to post to another account.

The invoice can be edited several times. Use of function keys moves the cursor to previous or next entry while the invoice is on the screen. A second chance to edit is a menu option. If the invoices have already been updated, another change is made by using adjusting entries. Once an invoice has been paid, it cannot be canceled or deleted.

When all invoices have been posted, a data entry register prints out. If the system is integrated with the *General Ledger* module, all entries are automatically posted. For a non-interfaced system, a hard copy of the entries is produced.

Handwritten checks can be entered into the payables system, and a manual register and update report are generated.

Check writing is easy with this MAI program. The checking account number is chosen, and the options of payment by cycle, due date or discount date are selected. A sample check pattern can

be run to align the checks in the printer, and starting check number is input. If the checks ran improperly, a restart function is available. After the checks have been printed and the paper is changed, a check register is printed.

A manual payment selection is available instead of automatic payment, and invoices are selected for payment on a vendor-by-vendor basis.

Four excellent accounts payable reports are generated by the system — an open invoice report, aged open invoice, cash requirements and a disbursement register.

At the end of the month, an end-of-period processing function is run to clear the files and zero out the totals. The checking account(s) can be reconciled with the bank statements, and a hard copy is printed.

I encountered some problems with an error message 16, which did not appear in the user's manual. A toll-free call to MAI's technical support resulted in a quick fix to the problem. If the program is run without using the Reset button, a problem with the CONFIG.SYS file occurs. However, once the system disk is in Drive A, reset, then everything works fine.

I was impressed with the technical support of MAI, as well as the ease of use of the program. Function keys made data entry much easier, and the program ran smoothly on the Tandy 2000 without any delays while the data was saved to disk. This software is easy to use, and no accounting knowledge is necessary.

(MAI, distributed by Tandy, One Tandy Center, Fort Worth, TX 76102, \$495)

1000/1200

Joe Lynn Payroll: Inexpensive and Complete

Life was surely simpler during the barter period. If someone helped you with your harvest, you helped him with his harvest or gave him a share of your crop. No paperwork; no forms; no taxes.

Well, for the small business operator with employees, life is not that simple

now. He has a few partners in the form of federal and state governments who require a lot of attention without contributing positively to the bottom line. Modern reality requires the hassle of preparing payroll checks, deductions for federal, state and Social Security (an interesting misnomer) taxes.

Also, there are deductions for medical insurance and other employee contributions with the joy of reporting and paying all of these deductions to the appropriate governmental or financial organization.

To assist the small businessman with these necessary payroll and withholding tasks, Joe Lynn Computer Services has released a payroll system utilizing the

capabilities of the Tandy MS-DOS computers to perform payroll calculations, posting and check printing.

Joe Lynn, who has previously released business-oriented programs for TRSDOS Tandy computers, has now focused his efforts on releasing software for the new Tandy MS-DOS machines.

The *Payroll System* actually consists of several programs and files all interacting together to form a payroll system which is extremely easy to operate. The only computer expertise required is the ability to insert a diskette and type PAYROLL. A series of menus then leads the user through the various steps necessary to enter employee data, maintain necessary year-to-date records and

print checks. No confusing technical jargon is used.

Although the program is simple to use, its capabilities are quite complete. The *Payroll System*:

- Calculates FICA, federal and state withholding tax plus four miscellaneous deductions automatically.
- Totals hours and wages for up to 10 departments.
- Allows miscellaneous deductions to be computed as a percentage of gross wages, amount per hour worked or fixed dollar amount.
- Has state withholding tax tables predetermined for each state.
- Maintains state and federal tax exemption independent from each other.
- Has the capability to exempt individual employees from FICA (Social Security).
- Maintains an employee status file which can be updated easily.
- Allows hourly or salary pay scales.
- Allows salary override.
- Calculates regular time, time-and-a-half and double-time for hourly employees.
- Prints checks and check stubs for a

single pay period with year-to-date totals on the pay stub.

- Allows sample checks to be printed to align printer.
- Has an automatic mode to print checks that have the same hours or salary each pay period.
- Lists all checks issued each pay period.
- Prints year-to-date, quarter-to-date and period-to-date totals.
- Computes and prints data for quarterly tax reports.
- Has the ability to convert data from an existing payroll system in the middle of a year.
- Handles up to 999 employees.
- Prints W2 forms.
- Lists all employees by number or alphabetically by last name.
- Uses a standard check form (NEBS #9022).

While these capabilities are not surprising and are contained in most full-featured payroll programs, what is surprising is that you get this all for \$49.95. Joe Lynn has evidently declared a software price war.

Curious about how such a complete

program could be offered at such a low price, I called him and was informed that software selling prices are determined by the actual production costs of the package (disks, binders, printed material, etc.), the costs of distribution (two-step software distribution and retailers profits), advertising costs and programmers profits. By selling direct, he feels that he can offer quality software comparable to packages selling for up to 10 times his price in sufficient quantity to make a fair profit.

The low price is also his way of combatting software piracy. He feels that the likelihood of customers copying and passing-on software diminishes if the purchase price is reasonable.

Whether or not his assumptions are accurate remains to be seen. However, this program at this price is certainly a value.

To handle the varying tax laws for each state, different program versions are released for each state with the proper tax withholding tables predetermined and embedded in the program. At year's end, these tax tables are not user-changeable. As federal, FICA and state tax rates change with the start of

Plot Against Your Competition!

with QuickPlot®

We're the people who gave the CGP-115 Color Plotter business status. With QuickPlot, your Model 100, or Tandy 200, produces high quality line-, bar- and pie-charts in vivid color. Simple data entry and flexible chart formatting makes QuickPlot and the CGP-115 Color Plotter the logical choice for the professional who wants to *plot* his profits—not *spend* them.

Complete QuickPlot Package Includes: Bar Chart, Pie Chart and Line Graph. Data and chart formats save to disk or tape for future plotting.

Model 100, Tandy 200 and CGP-115 are registered trademarks of Tandy Corporation.

a year, the purchase of a yearly update for half the current cost of the program is required to get the new tax tables.

To test the mathematical accuracy of the program, I ran it parallel to a megabuck existing payroll system, running on an IBM mainframe. The results were identical. The major functional differences between the two systems were that the *Lynn Payroll System* was limited to 999 employees and only four miscellaneous deductions.

A special payroll system for restaurants, (not tested) is available for \$149.95 which includes the ability to handle tips and draws.

If you are still producing a manual payroll, the costs and risks of computerizing your system are now very low. Besides the low price, a 30-day money-back trial period is offered. Since the program disk is not copy-protected, Joe is truly a trusting man. He would have enjoyed the barter system.

(Joe Lynn Computer Services, 23501 W. Gagne Lane, Plainfield, IL 60544, (815) 436-4477, \$49.95)

— Bruce Rothermel

Supercharge your ROM with *Textpro* and *Supera*

The more you use a machine like the Model 100, the longer your wish list of additional features grows. Some may be as routine as global search and replace or as sophisticated as a keyboard macro ability similar to what you already have on your desktop PC. Perhaps you hope to use the LCD as a video prompter. Or how about "windowing" on the small screen? Well, the 100 still doesn't do windows, but with a little software magic, you can look at one file while you edit another. The secrets are hidden in two programs from Micro Demon called *Textpro* and *Supera*. These programs shorten the wish list and boost your ROM power substantially.

Textpro and *Supera* combine many

unique and useful utilities into a single package. *Textpro* is a subset of *Supera* and contains all of its text capabilities.

Textpro and *Supera* load themselves from cassette after first determining your machine's memory size. What looks like a BASIC program now appears on the main menu. To turn *Supera* or *Textpro* on, place the cursor over the filename and press ENTER. The names of ROM TEXT (and for *Supera*, BASIC) are changed so you can tell at a glance whether *Textpro* or *Supera* is enabled. If need be, you can turn *Textpro* and *Supera* off and even get rid of them altogether. But heed the manual's warning; to kill these programs you must first turn them off or face a certain cold start.

The documentation for *Supera* is complete, accurate and full of examples. It is also large, bulky and difficult to read. The print in the *Textpro* manual is better but still not good. Both manuals would benefit greatly from typesetting. As always, a portable quick reference would be a further plus.

Textpro and *Supera* allow you to define 26 function keys (A-Z) and several special keys. Suppose you are

MODEL 12

TANDY 1200

TANDY 6000

TANDY 1000

TANDY 200

MODEL 4-P

Give your Model 100

128K

RAM

Installs as easily
as plugging
in a socket

Software included, transfers from bank to bank. Works like main menu! Includes powerful RAM Basic that lets programs store and access data from any other bank.

PCSG says: Satisfaction guaranteed or your money back within 30 days

As amazing as it seems you can upgrade your Model 100 to 128K of RAM in just 60 seconds.

It comes to you right out of the box looking just like the picture. You just open the little compartment on the back of your Model 100 with a quarter and it just pushes right into place. You can then put the cover back in its place.

You then have 4 banks of RAM of 32K each. The additional three banks also work just like your Main Menu.

You push a function key and you are in the second bank. Push again and you are in third, again, then fourth. Press it once again for your original bank.

It has its own built-in NiCad battery that recharges right from the Model 100 and its guaranteed for a full year.

What is really great is that you can copy a file from one bank to another with just a function key.

Each bank is like having another Model 100, and all the built-in programs as well as any snap-in ROM programs appear in all four banks and work the same way. Your widebar cursor moves from file to file and you access any file or run any program just by pressing ENTER.

What lets you copy any file from one bank to another is a snap-in ROM from PCSG called RAM+, that comes at no extra charge. It just pushes right into the little socket in that same compartment with the 96K expansion unit.

Not only does this firmware let you copy a file from bank to bank, but you can make a copy of any file within the same bank instantly with a function key. Great for Lucid spreadsheets!

Copy a file from bank to bank with a function key

You can also rename a file, or kill any file with just a function key. Plus you can do a whole lot of other useful things like setting the date, day and time with function key ease. You even have a function key that lets you use non-Radio Shack printers without having to make those tricky dipswitch settings.

RAM+ lets you cold start any one of your banks without affecting the other three. That means that anytime you want you can clean out a bank's entire memory, but leave intact all the files in the other banks.

What is also fantastic is that you don't have to have the ROM in place to use the additional RAM. Whenever you take out the snap-in ROM it leaves behind a tiny machine code program that lets you switch from bank to bank just by pressing ENTER.

This lets you use your ROM socket to snap-in other ROMs like LUCID spreadsheet, WRITE ROM text processor, or DISK+ ROM file transfer program, and use them in any or all four banks. All of these, by the way, are available from PCSG.

When you are ready to copy a file from one bank to another or use any of the other fantastic functions we talked about you can just snap the RAM+ ROM back into place.

Everybody that has this 128K system in their Model 100 is so excited, because it gives them four times the capacity and all banks work just like the Main Menu.

And what has made a lot of people happy is that the system bus, located in the same compartment, is left free for you to plug in a DVI or the Holmes Engineering/PCSG portable disk drive.

The ability to copy a file from bank to bank instantly with a function key, plus all of the other features make this RAM extension truly an engineering masterpiece.

Some people hesitate when they think of installing something, and then others are skeptical that any additional hardware could be as good as the Model 100 itself. That's why we sell these 96K expansions on a 30 day trial. Simply return it within 30 days for a full refund if you are not satisfied. Priced at \$425. MC VISA COD.

PORTABLE COMPUTER SUPPORT GROUP

11035 Harry Hines Blvd. No. 207, Dallas, Tx. 75229

VISA / MASTER CARD / AM. EXP. / C.O.D.

writing about *Supera*. You can assign the program name to a function key by pressing ESC 4. In response to the "key" prompt, type the letter S. Now type the exact character string you wish to assign (*Supera*). From then on, pressing ESC S will type *Supera* for you.

Need to check another file? *Texpro* and *Supera* enable you to view a second file while editing the first. If you write from an outline as I do, *Supera* can help. While composing a document, I can review my outline by simply pressing ESC 3 and typing the filename. Since I frequently do this, I assigned this process to a function key so that checking my outline is as simple as pressing ESC 0. Because there is no way to check a function key definition, I always use some sort of mnemonic device such as 'O' for "outline."

A variation on viewing other files is to create a special file called HELP.DD and view this help file by pressing ESC 6. You might use this to record the various special key sequences used in the program. In any case, you will need to experiment with this ability because the order in which the files are created seems to make a major difference. Some files appear instantly; others take so long that you are tempted to reset the machine. You do get an immediate message, and the manual reassures that "everything is OK."

If you are accustomed to other word processors, then you will appreciate the "type-over" ability that *Texpro* and *Supera* add to TEXT. Pressing ESC 1 turns on type-over and what you type replaces the text in your file. ESC 2 cancels type-over and returns you to "insert" mode.

One of the best features of *Texpro* and *Supera* is the addition of global search and replace to the TEXT program. The F4 key is assigned this function (one of the few times, unfortunately, that Micro Demon uses standard function keys). Unlike most search and replace programs for the Model 100, this one offers a prompted option. If you reply Y to the "Want Prompting (Y/N)" question, *Texpro* and *Supera* will show you each occurrence in context and let you decide whether you want to replace it. The prompted option makes search and replace extremely useful.

For proofreading a file, you can let *Texpro* and *Supera* do the scrolling. ESC followed by the down arrow key scrolls the current file a line at a time.

The timing is good for reading, but this function would be vastly improved if Micro Demon added the ability to adjust the speed of the scroll. In any case, you can pause the scrolling at any time by pressing the SHIFT key and resume scrolling with another SHIFT press. You really can use the LCD as a teleprompter and keep your speech notes on the small screen!

Texpro and *Supera* add a variety of special editing keys to TEXT. Key combinations are provided to delete a word or line, to substitute for the past function and to change the case of the character below the cursor. The real power of these programs comes in combining these editing functions in keyboard macros or function key definitions to automate editing. The manual provides example definitions to delete from the cursor to the end of the file, to erase every other line and to change the case of the previous word (since you forgot and left the CAPS LOCK on).

All features described thus far apply to both *Texpro* and *Supera* while in TEXT or while using the EDIT command to change BASIC programs. *Texpro* stops with TEXT, but *Supera* adds a great deal more to enhance the other ROM programs and main menu functions.

Supera offers a whole set of CTRL key combinations to enter the other ROM programs directly from BASIC, replace current function keys for LIST, FILES and MENU, and use the additional capabilities that *Supera* adds to your machine. *Supera* features a "calculator" mode, automatic line numbering in BASIC (at last!), and of course all the definable function keys already described. Because one set of function keys does not fit all ROM programs, *Supera* lets you save and restore whole sets of function keys.

Calculator mode in BASIC is particularly interesting. You can quickly check a calculation and save the result to a BASIC variable. *Supera* also converts decimal to hexadecimal and vice versa. It even makes provision for multiple PEEKs and POKES.

Now for file management from the main menu. *Supera* adds CTRL key combinations to kill, rename and check the size and memory location of files. The only wrinkle is that *Supera* will allow you to create duplicate filenames when renaming and even permits invalid filenames. The first is a nuisance;

the second is a real plus since it can be used to prevent accidental deletion of files. If Micro Demon would only use the Model 100's own function keys for these menu enhancements, they would be much less confusing.

But there is trouble in paradise. *Supera* comes with a starter set of function keys. These were not defined as documented. Fortunately, it was a simple matter to redefine them to specification.

I have two gripes with these programs. First, there is no way to check the definition of a function key without using it. When a key has been defined to do special or complex editing, this is totally unacceptable. The problem is worse as you build multiple sets of function keys. You must simply maintain an external list of function key definitions or use all your RAM for large "help" files.

My other gripe is that different ROM modes require different methods. To define a function key in BASIC you press CTRL D rather than ESC 4 as in TEXT. You can activate a function in BASIC either by ESC followed by the letter or by using SHIFT plus the letter while CAPS LOCK is down. This second method is the only one that works in TELCOM, SCHEDL or ADDRSS. So you invoke a function key from TELCOM in one fashion, from TEXT in another, while BASIC allows either. Since function definitions work across all modes, the use ought to be consistent. All this makes the function keys more difficult to use and less functional.

Texpro and *Supera* offer plenty of bang for the byte. But they may not appeal to the casual user of the Model 100 because of the many key sequences to master. If you are accustomed to other programs using CTRL key sequences, *Supera* and *Texpro* might not seem difficult at all. In any case, the search and replace and function key ability are well worth the price of admission.

Which do you need? If most of your work is with TEXT, save money and memory with *Texpro* (about \$30 and 1.5K). But if you want ROM performance, you'll really appreciate the *Supera* supercharge.

(Micro Demon, Inc., P.O. Box 50162, Columbia, SC 29250, 803-733-0908, 16K cassette, *Supera* \$79.95; *Texpro* \$49.95 plus \$3 S/H each)

— Dennis Kirley

VoiceCommand: Voice Recognition — For a Price

Many of us have seen those super intelligent computers and robots in the movies that talked and listened to the people who were (supposedly) their masters. After seeing this sort of thing, you start to wish you could do the same things with ordinary desktop computers in the real world.

Speech synthesizers have been in fairly wide use for some time and in some fields have already become old hat; but speech recognition is another matter entirely. Getting a machine to identify the words a person speaks with any degree of accuracy is something that has been sought at least as far back as the early 1960s when Dr. Harry F.

Olson at RCA demonstrated a crude version of a voice-operated typewriter. Lately there have been a number of voice recognition boards offered for various computers; judging by their limitations, HAL is still some time off (but may yet arrive by 2001). Meanwhile, Logical Business System's *VoiceCommand* is here now, and (although it is a bit awkward) it can be a very useful addition to a desktop computer.

The *VoiceCommand* board, which (like so many other products) was designed for the IBM PC, works just as well in the Tandy 1200. (It takes up the full length of a long slot, and won't fit in the Tandy 1000.) It needs 256K of RAM, and when you are actually using it you may need even more than that since the resident program involved takes up over 60K. The board has its own microprocessor and 16K of RAM for its own use (it doesn't appear in the computer's RAM space).

On the back plate is a microphone jack; a good directional mike should be used to keep down extraneous noises. The microphone that Logical sells works well, and costs \$79.95. Installation is no problem; please remember to unplug the computer first, but since it

does take up a slot and the Tandy 1200 then has only one slot left, you may end up needing one of the multifunction boards for the more common expansion options.

VoiceCommand comes with a good set of driver programs. VEXEC is the program that stays in RAM all the time and handles the task of controlling the board and passing commands to the computer. BVOICE loads a vocabulary into the board and into RAM, and also operates as a setup program to let you create and update vocabularies, train the system to recognize your voice for each word and check to see if everything is working properly. There are also a number of sample vocabulary files that let you try out the system quickly without having to create a vocabulary. A copy of Ashton-Tate's *Framework* demonstration disk is included with a vocabulary to match; it requires 384K, and the Tandy 1200 I used has only 256K, so I wasn't able to try it.

VoiceCommand can have a vocabulary of up to 500 words in place at a given time. The specs also say that a total of 32,000 words can be made available in up to 64 vocabulary files, but the manual isn't clear about how these limits were arrived at. A typical vocabulary will probably have only 20 to 30 words appropriate to a given application. The BVOICE program has an editor to let you set up the command words and action strings involved.

The action string is a string of characters that are to be entered, while the command words represent the words to be spoken. For example, the command word "directory" might stand for the directory command; the action string might be DIR. A windowing feature will let you specify that certain functions can be used only after others have been used. You could set the words representing the numerals one through nine, for instance, so they won't work unless you have opened the window by saying "numbers" first. Finally, there's a "popup" function that lets you, by saying "popup" while running an application, bring up a list of the available words without breaking out of the main program.

After you have a vocabulary file for the application you want to use, the next step is to "train" it to recognize your voice or that of the person who will be using the application. For each word in the file, *VoiceCommand* will memorize the pattern of your voice as you say the word. As far as I could tell, no

New dimensions in Bible study.

THE WORD processor

connection is needed between the word you typed in before and the word you speak; if you felt like being silly you could, while training a file, say "ruta-baga" and have it mean "directory." Since we hardly ever speak the same word in exactly the same way twice, *VoiceCommand* has some tolerance for different inflections; the manual claims that the board is 75 percent accurate after one training pass. You can run through the training procedure again; each time, as the "image" of the way you say each word becomes more accurate, so does the recognition process; after seven training passes the system is said to be 98 percent accurate. When we first tried out the *VoiceCommand* board we found that the system would occasionally accept commands from other people besides the person who had trained it; it wasn't reliable by any means, and Logical Business Systems doesn't recommend it, but it did happen.

Finally, starting up *VoiceCommand* to actually use an application is quite simple. You just enter VEXEC to load the main program, then type BVOICE followed by the name of the file and your initials. After the vocabulary is loaded,

you're ready to start giving commands by voice. Load up your application program, press the NUM LOCK key to enable voice input, and start talking. If at some point you (or someone else) says something that doesn't match a word in the vocabulary, the computer's speaker will beep to let you know. If you want to switch off the voice input at some point, just press NUM LOCK or switch off the microphone itself, if yours has a switch.

In our tests, *VoiceCommand* recognized words quite well as long as they were spoken distinctly, which is all one really has a right to expect at this stage. In a reasonably quiet office or home setting it should work just fine; a noisy environment, like a factory, will almost certainly cause trouble. If you have an application that uses a set of fixed commands and you'd like to convert it to voice input, *VoiceCommand* can fill the bill quite nicely.

(Logical Business Systems, 264 Santa Ana Court, Sunnyvale, CA 94086; board \$499, microphone \$79.95)

— Ed Ellers

Software 1000/1200/2000

Teleterm: Powerful Communications

If *Teleterm* were just a communications program, it would rate as a success in my book. In fact, *Teleterm* contains a host of features in addition to communications. Although full featured programs can be so complicated to learn that they become a trap for the novice, *Teleterm* can be easily mastered for basic communications. Advanced features, however, are available for the sophisticated user.

Entering TELETERM from DOS prompt yields the program's main menu. Selections include "Creator/Editor," "Communications," "Text Editor" and a "Translation Table Print" routine. Since communications will be the primary use of *Teleterm*, I will deal with that function first. Selecting the communications option from the main menu generates a "loading" message

that lasts 10 seconds or so. The screen clears and the user is asked for a terminal name. Actually it is the name of a disk file containing communication parameters that is being requested.

At this point the name of a terminal file may be entered. If the ENTER key is pressed instead, *Teleterm* will search available drives and list any files with a .TRM extension. The request for a filename is then repeated. The first time, I had no idea which file to choose, so I just picked one at random. Once I selected a file, its parameters were set and the communications help menu appeared. The A and P options of the help menu allow easy changing of the settings from the disk file. Once the settings are to your liking, those settings may be saved to disk as a new .TRM file. Next time, giving that filename will bring the communications mode up as you set it. For instance, I changed the parameters to the setup I use for CompuServe and saved that file as COM.PUS.TRM.

The help menu has 33 commands on it, but actually entering terminal mode is not one of them. Pressing ENTER puts you into terminal mode, ready for communicating. The immediate effect of this is that the screen goes blank.

PCM

Back Issue Availability

Back copies of many issues of PCM are still available.

All back issues sell for the single issue cover price. In addition, there is a \$2 charge for the first issue plus 50 cents for each additional issue shipped in the U.S. When possible, issues are shipped UPS. The postage cost in Canada and Mexico is \$3 for the first issue and \$1 for each additional issue.

VISA, MasterCard and American Express accepted. Kentucky residents please add 5 percent state sales tax. We do not bill and no COD orders accepted.

We suggest you order back issues you want now while supplies last.

There is supposed to be a "Teleterm ready" message at this point, but I only got it some of the time. Once in terminal mode, *Teleterm* sends the necessary signals to start communication with the machine on the other end of the line.

I think this is the place to comment on one of my problems with *Teleterm*. My experience was that the documentation was good and covered most of the information that a user would need. The organization of that information left something to be desired. My biggest problem was figuring how to get out of the various segments of *Teleterm*. The documentation was very good at telling you how to initiate a function, but how to exit was often left until the end of that section of the manual. The people at Telexpress seemed to appreciate my comments in this regard and promised to consider them carefully. The manual for the Tandy 2000 and MS-DOS versions had not been typeset and it is quite possible that some of my suggestions will make the final version.

Eventually you will discover that the ALT key serves as a control key when in terminal mode. Most of the commands available from the help menu are available from within terminal mode by pressing ALT and the key together. Pressing ALT H will return you to the help menu itself. If you are in contact when you press ALT H, *Teleterm* will maintain contact while you access commands on the help menu. Being able to change settings such as echo without breaking contact is very useful.

Teleterm supports both unblocked ASCII file transfer and the XMODEM protocol for sending and receiving files. Both of these methods allow file transfer directly to or from disk. This means that the size of the file you can send or receive is limited only by the capacity of your disk and/or the length of time you can spend connected.

There is also a special mode for transfer called *Teleterm* blocked mode. This method uses an error checking procedure to assure accurate file transfer, but can be used only when both computers are using *Teleterm*. The documentation does mention the fact that XMODEM transfer is also referred to as "Ward Christensen" and "MODEM7." This bit of information will be helpful to beginners since I have found that every bulletin board uses a different name for the upload/download protocols.

The first time I used *Teleterm*, I opened the memory buffer to receive the

data coming in from a session on CompuServe. When this buffer gets full, a message appears to that effect and a filename is requested to save the buffer. The technical people at Telexpress told me how to avoid this problem, but had I written the manual, I would have bragged about the receive direct to disk feature. If you set the receive-to-disk mode at the beginning of a session, all incoming data is saved to a disk file on the fly. As the buffer fills, *Teleterm* writes it to disk without operator intervention. The display leaps ahead after completion of disk access indicating that the incoming data is still being accepted during the disk write.

Mention of the memory buffer brings up another important feature of *Teleterm*. One of the options at the main menu is a text editor. This editor is also accessible from the communications mode and can be used to edit whatever is in the buffer. For many applications it is a major convenience to have a text editor built in to your terminal program. Received text can be edited in the buffer before it is saved to disk. Outgoing files can be loaded to the buffer, edited and then transmitted. Messages and responses to received mail can be composed and edited in the buffer rather than typed on the fly. *Teleterm* will stall with the appropriate signals while you use the editor online. While the text editor has adequate editing commands and will provide a printed copy of text in the editor, it is not intended as a word processor and will not format the text. Its major drawback is the lack of a command to make the cursor jump to either end of a line.

Teleterm can also be used to make your computer emulate a specific type of terminal. Files come on the disk that will emulate most of the common types of terminals. In addition, a feature called "Creator/Editor" asks the user a myriad of questions about how the computer should act in terminal mode. Once these questions have been answered, the results may be saved as a disk file. If you know what is expected of a terminal, you should be able to use *Teleterm* to emulate any kind of terminal.

Six different conversion tables within *Teleterm* can be edited by the user. These tables control characters going in and out of the RS-232 port, to the printer, to the video and from the keyboard. This feature becomes important if the other end sends characters that will make a mess. Changing the

RS-232 input conversion table will intercept those characters before they can cause trouble. The same procedure can prevent graphics characters from reaching the video display and wreaking havoc.

Teleterm can utilize the auto-dial feature of Hayes' and several other modems and will store up to 10 phone numbers to be recalled with a keystroke or two. There is also an unattended mode of *Teleterm* that will allow calls to be received or made at specified times without intervention of the operator. If you would like to call home and send files to your computer, this is a handy feature.

Teleterm is available in an IBM version that will run on the Tandy 1000, 1200 and many other compatibles. It also comes in a separate version for the Tandy 2000 (IBM version will not work on a 2000). There are also versions for the TRS-80 Model 4/4P, TRS-80 Models II/12/16 and a Xenix version.

(Telexpress, P.O. Box 217, Willingboro, NJ 08046, 609-877-4900, \$199.95)

Zvert ZVT-630 Diablo Printer Emulator makes 'LaserJetting' Simple

The world of computer printing was changed forever when Hewlett-Packard unveiled the LaserJet, introducing a new breed of computer printers. Unfortunately, though, the world of word processing was still using the old breed of software that didn't exactly work with this new technological wonder. You see, the word processing software that most people were using at that time (and even still) knew only how to "talk" with the old faithful daisy wheel and dot-matrix printers. The LaserJet presented a whole new array of features and complexities.

Into this chaos came a wonderful product from Zvert Corporation — the ZVT-630 Diablo 630 Emulator. It is a magical box that fits between your computer and your LaserJet printer and

makes the LaserJet think it's a "super-charged" Diablo 630, a popular daisy wheel printer.

Suddenly, your old faithful *WordStar*, *Multimate* or just about any old word processor you have can become LaserJet compatible. Your word processor can happily send Diablo 630 codes for centering, underlining, setting margins, etc., the ZVT-630 can change them around, and your LaserJet will think your computer is talking in *its* lingo.

In addition to translating Diablo codes into LaserJet talk, the ZVT-630 performs a couple other minor miracles. It converts signals from your computer's "normal" parallel printer interface to the RS-232 signals required by the LaserJet. It will also allow you to connect up to three computers to a single LaserJet printer (one parallel and two RS-232 serial). In this shared configuration, the Zvert box will automatically handle each computer's output and, if necessary, will put one computer's print job on hold while another's is being printed.

Aside from allowing one to easily use the LaserJet printer, the ZVT-630 adds

The Preble NavComp II Two Aviation Programs in one package! New Enhanced Version For the Model 100 or new Tandy 200!

NavPin
For Flight Planning

- Creates Navigation Log!
- Saves Route of Flight for repeat use!
- Compensates for Climbs and Descents!
- Statute or Nautical measurements!
- Self Prompting with error prevention!
- Fly direct or use VORS!
- And many other advanced features!

NavAid
For In Flight Navigation

- Tracks your flight in Real Time!
- Modify Flight Data as necessary!
- Incredible Graphic displays!
- Shows Position, Fuel, Intersections!
- ETA'S, Ground Speed, and much more!
- Turn off and on without data loss!

Requires Radio Shack Model 100 with at least 16K or the new Tandy 200!

Attention Radio Amateurs! Announcing: The Preble HAMTERM! For the Model 100 or new Tandy 200!

- Radioteletype operation for BAUDOT, ASCII, AMTOR, CW!
- Split Screen Operation in receive mode with unlimited type ahead capability!
- Word Buffer in Transmit Mode! Corrects errors before they are sent!
- Automatic CQ! — Automatic Station Call! — Automatic Logging!
- Echo to printer! — Download! — Upload! — Send Time and Date! — Send RYRY!
- And many other advanced features!

Requires Kantronics UTU, RS Model 100 with at least 16K or the new Tandy 200!

The Preble NavComp: Only \$34.95

The Preble HAMTERM: Only \$29.95

Shipping and handling \$1.50 to U.S. and Canada — \$5.00 to other countries.

Free Brochures available!

VISA, MasterCard or COD is OK!

a nice feature to the printer that normally requires programming or the purchase of an additional font cartridge (these cost about \$250 each). The Zvert box will simulate bold printing. The standard Diablo code signals the emulator to take care of this automatically.

Because of the nature of this device, getting it connected and configured is not something the average user could do easily. Not that it is *that* difficult, there's just a lot of talk about Baud rates, DTRs and parity that might scare some people away. In its favor, however, the box comes preset to work with the most common configuration.

Once the box is set up, using it is as simple as flipping a power switch and pressing the "option select" button to put it in "emulation mode."

The manual supplied with the emulator is printed with (what else) a LaserJet printer. A good amount of space is devoted to connecting and setting the DIP switches on the box. However, there is little information on using the emulator's port sharing capabilities. A mark in the manual's favor, though, is the inclusion of a complete list of supported Diablo 630 control codes

with comments on how they work with the emulator.

One of the nicer features put into this box is the "pass through" mode. It will force the box to send data straight through to the printer without translation. This mode is handy if you happen to have software set up specifically for the LaserJet printer, but still want to use the emulator for its other features.

The ZVT-630 worked flawlessly in our testing. If one does experience problems with the emulator, the self-test feature will print a report on its condition and DIP switch settings.

WordStar was used to test the emulator and, aside from some bugs in our version of the *WordStar* Diablo 630 driver, it worked beautifully. We printed the *WordStar* PRINT.TST file with the emulator. It was able to do boldface printing, underlining, "strike-out," superscripts, subscripts and variable-pitch printing perfectly. How nice it is to finally be able to use *WordStar* with the LaserJet.

There are some Diablo 630 codes the ZVT-630 will not recognize. For the most part, these are due to the differences between daisy wheel and laser

printing. Most notable of these missing codes are those that control proportional printing and Diablo's *HYPLIT* graphics.

The ZVT-630 emulator adds some codes of its own to the standard Diablo set. These codes are for special support of the LaserJet printer. Codes are provided to switch between "portrait" (vertical) and "landscape" (horizontal) text orientation, select the number of copies, reset the printer and perform a self-test of the printer. A "transparent print" code is provided to allow you to pass through Hewlett-Packard codes directly to the printer.

In summary, if you are currently using a word processor that does not support the LaserJet and have or are contemplating purchasing a LaserJet, the Zvert ZVT-630 emulator would be a wise buy. If you currently have a Diablo 630 and want to upgrade to the speed of the LaserJet, this product is made for you.

(Zvert Corporation, 12421 Venice Boulevard, Suite 8, Los Angeles, CA 90066, \$599)

— Danny Humphress

*Subscriptions to PCM are \$28 a year in the United States. Canadian rate U.S. \$35. Surface rate to other countries U.S. \$64; air rate U.S. \$85. Kentucky residents add 5% sales tax. All subscriptions begin with the current issue. Please allow 5 to 6 weeks for first copy. **U.S. currency only, please.** In order to hold down non-editorial costs, we do not bill.

The following products recently have been received by PCM, examined by our magazine staff and approved for the PCM Seal of Certification, your assurance that we have seen the product and have ascertained that it is what it purports to be. This month the Seal of Certification has been issued to:

Astro*Talk, accepts date, time and place of birth and generates accurate astrological data for use in determining horoscopes. *Matrix Software, 315 Marion Avenue, Big Rapids, MI 49307, (616) 796-2483. Requires Tandy 1000 or 1200, \$39.95*

Chart-Master, translates data from popular spreadsheet programs into professional charts and graphs. Works with most popular plotters and dot-matrix printers as well as the Hewlett-Packard LaserJet printer. *DecisionResources, Inc., 25 Sylvan Road South, Westport, CT 06880, (203) 222-1974. Requires Tandy 1000 or 1200 with graphics, \$375.*

Data Manager System, a personal filing system for the Tandy Model 100. Package includes manual and cassette software. *Tandy, distributed through Radio Shack stores nationwide. Requires a 16K Model 100, Catalog No. 26-3836, \$39.95.*

Debug/Assembler, a program allowing you to write and edit 8085 assembly language programs on the Model 100. *Tandy, distributed through Radio Shack stores nationwide. Requires a 32K Model 100, Catalog No. 26-3823, \$49.95.*

Diagram-Master, creates business diagrams such as organization charts and Gantt Schedules. Prints charts on plotter, dot-matrix or laser printer. *DecisionResources, 25 Sylvan Road South, Westport, CT 06880, (203) 222-1974. Requires Tandy 1000 or 1200 with graphics, \$345.*

The Factory: Strategies in Problem Solving, a computer-aided instructional package for teaching strategy. Includes training diskettes and teacher guide. *Sunburst Communications, 39 Washington Avenue, Pleasantville, NY 10570, (914) 769-5030. Requires Tandy 1000, \$59.*

Function Plotter, allows printing graphs of algebraic functions of one or two variables. Program supplied on cassette. *Tandy, distributed through Radio Shack stores nationwide. Requires a 16K Model 100 and any one of Tandy's plotters, Catalog No. 26-3834, \$19.95.*

Hot Dog Stand: Survival Math Skills, a program designed to motivate students in grades 6-12 to develop practical mathematical skills. Includes diskette and teacher guide. *Sunburst Communications, 39 Washington Avenue, Pleasantville, NY 10570, (914) 769-5030. Requires Tandy 1000, \$59.*

Inside 1-2-3, a self-study training package for users of Lotus 1-2-3. Includes tutorial manual and diskette containing practice worksheets. *Hayden, 10 Mulholland Drive, Hasbrouck Heights, NJ 07604, (201) 393-6306. Requires Tandy 1000, 1200, or 2000, and Lotus 1-2-3, \$49.95*

Inside Framework, a training package for users of Ashton-Tate's *Framework*. Includes self-paced learning manual and diskette with examples of *Framework* files. *Hayden, 10 Mulholland Drive, Hasbrouck Heights, NJ 07604, (201) 393-6306. Requires Tandy 1000, 1200, or 2000, and Framework, \$49.95*

Inside Symphony, a book/software package for training users of Lotus *Symphony*. Includes instruction manual and sample data diskette. *Hayden, 10 Mulholland Drive, Hasbrouck Heights, NJ 07604, (201) 393-6306. Requires Tandy 1000, 1200, or 2000, and Symphony, \$49.95*

Interactive Solutions, a cross-referencing program consisting of a database manager, spreadsheet and word processor. *Tandy, distributed through Radio Shack stores nationwide. Program supplied on plug-in ROM. Requires a 16K Model 100, Catalog No. 26-3844, \$149.95.*

The King's Rule: Mathematics and Discovery, a program using a fantasy game format to teach the generation and testing of mathematical hypotheses. Includes diskettes and teacher guide. *Sunburst Communications, 39 Washington Avenue, Pleasantville, NY 10570, (914) 769-5030. Requires Tandy 1000, \$59.*

MAI BASIC Four Inventory, an inventory program designed to work alone or in conjunction with other MAI BASIC Four accounting packages. *Tandy, distributed through Radio Shack stores nationwide. Requires Tandy 2000, Catalog No. 26-5214, \$495.*

Offix, an integrated office productivity program with applications for filing, word processing, forms design and report generation. *Tandy, distributed through Radio Shack stores nationwide. Requires 256K Tandy 1000, 1200 or 2000, two floppy disk drives or one hard disk, Catalog No. 26-5325, \$99.95.*

Sign-Master, a graphics program that creates text pages, headlines and other "word charts" on a plotter or dot-matrix printer. *DecisionResources, Inc., 25 Sylvan Road South, Westport, CT 06880, (203) 222-1974. Requires Tandy 1000 or 1200 with graphics, \$245.*

Thoroughbred System I, a handicapping system designed to help horse racing fans earn more at the track. *PDS Sports, P.O. Box E, Torrance, CA 90507, (213) 516-66 88. Requires Tandy 1000 or 1200, \$129.*

By awarding a Seal, the magazine certifies the program does exist, but this does not constitute any guarantee of satisfaction. As soon as possible, these hardware or software items will be forwarded to PCM's reviewers for evaluation.

Using *BAREAD 2.1*

Bar code listings must be read in numerical order beginning with Line 1 and continuing through the last line of the listing. The computer display is used to prompt you as to which line to scan and give you warning messages should you happen to get out of step.

When you run *BAREAD*, it asks you to scan the first line of the bar code listing. This line contains the name of the program as well as the beginning of the program itself. The computer will sound a high-pitched beep whenever it's ready for you to scan a line. After a line has been successfully read, you'll hear a lower beep. A "blip-bloop" sound prompts you to turn your attention to the screen for a message. You'll hear this when you accidentally scan a line out of sequence.

After reading the first line, you continue scanning with

the second line. Remember to wait for a high beep before scanning and then listen for a low beep to indicate a successful read.

Once the last line of the listing has been scanned, *BAREAD* will return control to the Tandy 100/200 menu screen. Note that the program you just scanned is now in the directory with a .DO extension.

The final step is to convert the .DO text file to a normal BASIC program. This is done quite simply by going to BASIC and loading the file with a command such as LOAD "TEST.D0" (if the program name were TEST). The program will load into BASIC and will be ready to run. To save the program in BASIC's compressed format (.BA extension), you'd type SAVE "TEST" (if the program were named TEST). You may then kill the .DO file with KILL "TEST.D0".

6 ROM

BANK

plus powerful Nicad battery pack that gives 30 hours of power to your Model 100

\$269

A joint PCSG/CRYPTRONICS project.

Now you can access LUCID, DISK +, WRITE ROM, RAM+ and others instantly.

The 6 ROM BANK plus battery pack lets you have the ultimate Model 100 system. When you get your unit just press in up to 6 ROMS into the sockets then push in a simple plug into your Model 100's ROM socket. The ROM bank has two posts on either end that insert into the two little holes on the underside of your Model 100.

The ROM bank props up the Model 100 at the same angle and height as those little legs you've seen. The ROM BANK itself is only about 1½" deep and it runs the width of your Model 100. It only weighs one pound. It not only installs instantly, but it pops free in a second if you need everything to lie flat in a briefcase.

Change from ROM to ROM with the touch of a thumb switch.

You can go from LUCID to WRITE to DISK+ to any other ROMS just by turning the thumb switch at the side of the ROM bank. The 6 ROM BANK is a sturdy well built construction that looks like it is a part of your Model 100.

What is also fantastic is that the ROM bank has a powerful NICAD battery and recharger built right in. This power source supplies up to 30 hours of life to your Model 100 with just 6 hours of recharge. What's nice is that it recharges right from your Model 100's power adapter. This is a quick charge system and if you need power in a hurry, you can get 6 hours of life for your Model 100 by just charging for an hour and half.

Suddenly, the Model 100 is a very powerful computer.

If you have the HOLMES portable disk drive with its powerful bundled database software package or the CRYPTRONICS 128K RAM expansion along with LUCID, WRITE ROM and DISK+ in the 6 ROM bank with its rapid rechargeable NICAD power source, you have the ultimate portable system. It's all available only from PCSG.

As usual we don't want you to take our word for it. The 6 ROM BANK is sold on a 30 day trial. If you are not satisfied simply return within thirty days for a full refund. MC, VISA, AM. EXP. or C.O.D.

SUPER ROM **Lucid Spreadsheet Write ROM Database Outliner**

NOW YOU CAN REALLY HAVE IT ALL!

All on one ROM. Truly the finest four programs available for the Model 100 — guaranteed. Try it for 30 days. If you aren't blown away by the excellence return it for a full refund.

\$199⁹⁵

The four best programs for the Model 100 all on one ROM. 32K of power without using any RAM for program storage. This is the PCSG Snap-In ROM that just presses easily into the little ROM socket in the compartment on the back. You access the four right from the main menu like built-ins.

Write ROM — the definitive word processor for the Model 100. Function key formatting or dot commands. Search and replace. Library feature — inserts words, phrases or whole documents into text from just a code. MAP lets you see a picture of your document. In all there are 60 features and functions. No one can claim faster operation. FORM lets you create interactive forms with on-screen prompts that you can answer from the keyboard. Nothing else for the Model 100 compares with the features of Write ROM. Exactly the same as the Write ROM sold as a single program. Infoworld says it "makes the Model 100 a viable writing unit ... sur-

passed our highest expectations for quality and clarity."

Lucid Spreadsheet: This is the one PICO magazine says "blows Multiplan right out of the socket" and Infoworld performance rated as "excellent" and said "makes the Model 100 compute." Gives you features you cannot get with Lotus 123. Lets you build spreadsheets in your Model 100 that would consume 140-150K on a desktop. Program generating capability with no programming knowledge required. Variable column widths. Includes find and sort with function key control. It's fast, recalculates like lightning. No feature has been taken from the original, only new ones added.

Database: This is a relational data base like no other. You can do everything from mailing lists to invoices. No complicated pseudo-coding, you create input screens as simply as typing into TEXT. You are not limited by size; you can have as large an input screen as you wish. Prints out reports or forms, getting information from as many files as

you like. Complete math between fields. Total interface with Lucid worksheets.

Outliner: Does everything that Think-tank does on a PC but a whole lot better. Includes a Sort for your headlines. Lets you have headlines of up to 240 characters. Has cloning, hoisting and sideways scroll up to 250 characters. Like Lucid, this one sets a new standard for outliners. This is the way to plan and organize your projects.

Present Lucid and Write ROM owners can upgrade for \$100. If you have both it's \$75.

As usual PCSG sells the Super ROM on a thirty day guarantee. If for any reason you are not satisfied, simply return it for a full refund.

We are excited about this product. Super ROM gives the Model 100 the true power of a desktop. No other multi-program ROM has software that compares. But don't take our word for it. We invite you to make that comparison yourself. Priced at \$199.95 on Snap-In ROM.

*Got stuck with somebody else's multi-ROM?
We'll upgrade it for \$100.*
